

# Wisconsin PreACT<sup>®</sup> Secure<sup>™</sup> Technical Report

WISCONSIN  
DEPARTMENT OF

**Public  
Instruction**

**Prepared by: WDPI & ACT  
Spring 2023**

**ACT<sup>®</sup>**

Version 1.0

## Preface

The purpose of this manual is to provide the state of Wisconsin and their stakeholders with technical information regarding the PreACT Secure assessment. Additional information can be found in [The PreACT<sup>®</sup> Secure<sup>™</sup> Technical Manual](#), which provides technical information about the PreACT Secure assessment, including national-level reliability, scaling and equating, and validity evidence. This technical report provides Wisconsin-specific information based on the 2022–2023 academic year.

The principal purpose of *The PreACT Secure Technical Manual* is to document technical characteristics of the PreACT Secure test in light of its intended uses and interpretations. *The PreACT Secure Technical Manual* documents the collection of validity evidence that supports appropriate interpretations of test scores and describes various content-related and psychometric aspects of the PreACT Secure. Multiple test design and development processes are articulated documenting how ACT builds the assessment in line with the validity argument and how concepts like construct validity, fairness, and accessibility are attended to throughout the process. Also described are routine analyses designed to support continuous improvement and research intended to ensure that the program remains both psychometrically and educationally sound.

We encourage individuals who want more detailed information on a topic discussed in this manual, or on a related topic, to contact Wisconsin Department of Public Instruction (WDPI) or ACT.

## Commitment to Fair Testing

ACT endorses and is committed to complying with The Standards for Educational and Psychological Testing (AERA, APA, & NCME, 2014). ACT also endorses the Code of Fair Testing Practices in Education (Joint Committee on Testing Practices, 2004), which is a statement of the obligations to test takers of those who develop, administer, or use educational tests and test data in the following four areas: developing and selecting appropriate tests, administering and scoring tests, reporting and interpreting test results, and informing test takers. ACT endorses and is committed to complying with the Code of Professional Responsibilities in Educational Measurement (NCME Ad Hoc Committee on the Development of a Code of Ethics, 1995), which is a statement of professional responsibilities for those involved with various aspects of assessments, including development, marketing, interpretation, and use.

We encourage individuals who want more detailed information on a topic discussed in this manual, or on a related topic, to contact ACT.

# Chapter 1

## PreACT<sup>®</sup> Secure<sup>™</sup>

### ACT's Mission

ACT has been dedicated to improving college and career readiness for all students since its inception in 1959. ACT's renowned longitudinal system of assessments, with the ACT<sup>®</sup> test as a capstone, has provided students, educators, and policymakers with unparalleled measures of college and career readiness. ACT's mission is helping people achieve education and workplace success.

### 1.1 Philosophical Basis for ACT Tests

PreACT<sup>®</sup> Secure<sup>™</sup> shares a philosophical basis with the ACT. These two testing programs measure student development in the same subject areas of English, math, reading, and science. The principal difference between the two programs is length: PreACT Secure is shorter than the ACT in terms of both testing time and the number of items. PreACT Secure, has a greater emphasis on knowledge and skills typically attained early in students' secondary school experience (by the end of Grade 10). The ACT, for 11th and 12th grades, focuses on knowledge and skills attained as the cumulative effect of the school experience.

Because the content of PreACT Secure is linked to the ACT framework, understanding the philosophical basis of PreACT Secure requires an appreciation of the philosophical basis of the ACT.

The ACT is designed to measure how prepared students are for college academics. The principal philosophical basis for the ACT is that college preparedness is best assessed by measuring, as directly as possible, the academic skills that students will need to perform college-level work. Thus, the ACT is designed to determine how skilled students are at solving problems, grasping implied meanings, drawing inferences, evaluating ideas, and making judgments in subject-matter areas important to success in college.

Also, the ACT is oriented toward the general content areas of college and high school instructional programs. The test questions require students to integrate the knowledge and skills they possess in major curriculum areas with the stimulus material provided by the test. Briefly, then, the philosophical basis for the ACT rests on two pillars: (a) the tests should measure academic skills necessary for education and work after high school, and (b) the content of the tests should be related to major curriculum areas.

### 1.2 Overview of PreACT Secure

PreACT Secure is designed to predict performance on the ACT test for English, math, reading, and science; it is targeted for 10th grade but is also commonly administered to students in 9<sup>th</sup> grade. Like all ACT assessment programs, PreACT Secure is based on the belief that students—and their parents or guardians, teachers, counselors, and school administrators—will

make more productive plans and decisions if they have organized, relevant information available when they need it most.

PreACT Secure is vertically aligned to measure educational progress in the context of preparing for the ACT and planning for college and careers. PreACT Secure includes four multiple-choice test sections—English, math, reading, and science. The results from PreACT Secure can be used to help students plan their coursework and other learning opportunities to help ensure that they are prepared for the ACT and their postsecondary goals. High schools can use PreACT Secure data for academic advising, counseling, and program evaluation. The secure nature of the assessment also lends itself to evaluating readiness for college courses and advanced high school courses, identification for talented and gifted programs, and eligibility for scholarships. PreACT Secure may be used for local, state, or federal accountability, where accepted.

ACT provides customers with administration materials, including interpretive guides for score reports. The PreACT Secure individual student report, which each PreACT Secure examinee receives, contains sections about the student's scores, predicted ACT and ACT<sup>®</sup> WorkKeys<sup>®</sup> National Career Readiness Certificate<sup>®</sup> (NCRC<sup>®</sup>) scores, and ideas for progress. The interpretive guide called *Using Your PreACT Secure Results*, along with the PreACT Secure individual student report, can help students get a better sense of where they are, where they might want to go, and how to get there.

PreACT Secure functions as a stand-alone assessment and as a precursor to the ACT. When used together, these assessments give high school educators a powerful interrelated sequence of instruments for measuring student development. PreACT 8/9<sup>®</sup> can also be used with PreACT Secure and the ACT, providing an earlier measure of development toward college and career readiness.

PreACT Secure and ACT test scores are reported on the same scale; the range of PreACT Secure scale scores is from 1 to 35, while the range of ACT scale scores is from 1 to 36.

PreACT Secure also provides standards-based interpretations through the ACT College and Career Readiness Standards—statements that describe the knowledge and skills students have demonstrated through their performance on the test. Because the Standards focus on the integrated higher-order thinking skills that students develop in Grades K–12 and that are important for success both during and after high school, the Standards provide a common language for secondary and postsecondary educators.

Using the Standards, secondary educators can determine the skills students are likely to have and those they are ready to learn next. The Standards clarify college expectations in terms that high school teachers understand.

The Standards also offer teachers guidance for improving instruction to help correct student deficiencies in specific areas. PreACT Secure and ACT results can be used to identify students who are college ready or on target for college readiness. The ACT College Readiness Benchmarks—for English, math, reading, science, and STEM—were developed to help identify

examinees who would likely be ready for college-level work in these subject areas. The PreACT Readiness Benchmarks are the scores indicating that students are on target for meeting or exceeding the ACT College Readiness Benchmarks. [Chapter 5](#) provides details about the College and Career Readiness Standards and the College Readiness Benchmarks.

PreACT 8/9, PreACT, PreACT Secure, and ACT results give schools a way to get students engaged in planning their futures. Table 1.1 summarizes the assessments' components.

**Table 1.1.** Components of ACT College and Career Readiness Assessments

Component		Assessment

## PreACT Secure Individual Student Reports

The PreACT Secure individual student report facilitates interpretation of PreACT Secure scores with respect to college readiness, predicted performance on the ACT test, and national norms. Reporting category scores are presented for each test section (English, math, reading, and science), showing how students performed on different topics within each subject. Ideas for progress based on ACT College and Career Readiness Standards are organized by reporting category.

Each reporting category is based on a subset of items in the test section. For each reporting category, the student report shows the following:

- Total points possible
- Total points achieved
- Percent correct

Additionally, PreACT Secure reports Progress Toward the ACT National Career Readiness Certificate. This indicator represents a prediction of the level students are likely to earn on the ACT NCRC if they take ACT® WorkKeys® in 11th grade.

The report is accompanied by a booklet, *Using Your PreACT Secure Results*, which provides interpretive information about the test results, describes ACT services and policies, and tells examinees how to contact ACT for further information.

### 1.3 Purposes, Claims, Interpretations, and Uses of PreACT Secure

In creating PreACT Secure, ACT employed a theory of action (TOA) that integrates content validity (academic research, curriculum information, and standards) with predictive validity (empirical data), thus following methodologies similar to those used to build the ACT. The TOA begins by answering fundamental questions about the purpose of the assessment, such as, “Who are the intended users? What are the intended uses of the assessment results? What claims should be supported by the assessment? What are the intended benefits that may result from using the assessment? What are the measurable outcomes from using the assessment?”

The answers to these questions emerge from rigorous research and data collection that inform and allow for the identification of high-value skill targets in each subject area, providing focal points for the development of tasks and test forms. The TOA’s process further gives rise to possible ways of achieving the intended goals of the assessment. For example, cognitive labs, piloting, and field testing are used to validate results and iteratively improve the specifications and design of the assessment. Operational results are used to continuously improve the components of the assessment.

### Intended Users

High school students are the target population and primary users of the assessment. While PreACT Secure can be taken by students at any grade level, testing in 10th grade is recommended to optimize the benefits of testing. Additional users include parents and

guardians interested in their child's performance, teachers interested in helping students to identify areas of improvement, high school counselors and academic advisors responsible for helping students with postsecondary planning, and school administrators responsible for evaluating educational programs. PreACT Secure users could also include other organizations promoting college and career programs and talent identification programs. State education agencies may also use PreACT Secure as part of their state's accountability system.

## Intended Uses

The primary uses of PreACT Secure include:

1. monitoring progress toward college and career readiness,
2. predicting performance on the ACT and ACT WorkKeys tests, and
3. identifying academic gaps and areas for improvement.

Use 1 is supported by the ACT College Readiness Benchmarks and the PreACT Readiness Levels. Students who score at or above the ACT College Readiness Benchmarks demonstrate that they are ready for first-year college courses in the related subject areas. Student achievement is expected to grow between PreACT Secure (given in 9<sup>th</sup> and 10<sup>th</sup> grade) and the ACT test (typically given in 11<sup>th</sup> and 12<sup>th</sup> grade). Therefore, students who score below the ACT College Readiness Benchmarks in 10<sup>th</sup> grade may still be on target to meet the Benchmarks in 11<sup>th</sup> or 12<sup>th</sup> grade. Based on their scores, students are placed at one of three PreACT Readiness Levels: On Target, Close to Target, and In Need of Intervention. Use 1 is also supported through the Progress Toward the ACT National Career Readiness Certificate Indicator.

PreACT Secure tests are shorter than the corresponding ACT tests and are vertically aligned to predict student performance on the ACT (excluding writing), supporting Use 2. Predicted ACT score ranges are reported for English, math, reading, science, Composite, and STEM. PreACT Secure simulates the ACT testing experience and provides students, parents, and educators with valuable insights while there is still time to gain needed knowledge and skills, which can later be demonstrated on the ACT.

PreACT Secure results can help students and educators identify academic gaps and areas for improvement (Use 3). Percentile ranks can help students identify relative strengths or weaknesses in certain subject areas. Within each subject area, reporting category scores let educators see how students performed on each topic aligned to the ACT College and Career Readiness Standards. The PreACT Secure online reporting package includes four early intervention rosters, several summary reports, and data tools to support additional data analysis.

Additional intended uses of PreACT Secure include:

4. gauging readiness for advanced high school and college courses,
5. evaluating school and program effectiveness,
6. understanding performance relative to national norms, and

7. satisfying accountability testing and reporting requirements.

## Claims

The claims of PreACT Secure are closely related to the intended uses and are supported by other evidence contained in this technical manual. The primary claims include the following:

1. PreACT Secure measures where students fall on an empirically derived college and career readiness trajectory. See [Chapter 5](#) for more details on the ACT College Readiness Benchmarks, PreACT Readiness Benchmarks, and Progress Toward the ACT National Career Readiness Certificate Indicator.
2. PreACT Secure scores are strong predictors of ACT English, math, reading, science, STEM, and Composite scores. See [Chapter 6](#) for more details on how the predictions are derived, and see [Chapter 7](#) for additional evidence of how well PreACT Secure scores predict ACT scores.
3. PreACT Secure provides instructionally actionable information to students, parents, and educators. PreACT Secure data can be used to identify students' strengths and weaknesses in content areas at a variety of levels (student, classroom, school).

The secondary claims of PreACT Secure include the following:

4. PreACT Secure scores can be used to identify students who are ready to succeed in advanced high school courses, including AP and dual enrollment courses. See [Chapter 7](#) for evidence of how well PreACT Secure test scores have predicted success on AP exams.
5. PreACT Secure can be used as one component of the evaluation of school, program, and curriculum effectiveness. When PreACT Secure is used in conjunction with the ACT test, growth measures can be used to help evaluate educational programs. See Chapter 8 of the [PreACT Secure Technical Manual](#) for more information on how PreACT Secure scores can be used to measure student growth.
6. PreACT Secure allows users to understand how students at the same grade level and semester performed relative to the ACT-tested U.S. population. See [Shin and Xu \(2023\)](#) for details on the PreACT Secure norming studies.
7. PreACT Secure improves test security through shorter testing windows and secure control of test content.

## Intended Benefits

- Students are exposed to the types of content featured on the ACT and to the ACT testing experience.
- Students get predicted ACT scores, which help them understand how their performance is related to college and career readiness.
- Students, parents, and educators understand relative strengths and weaknesses in four subject areas that are also assessed by the ACT.
- Schools and districts gain important insights about curriculum and program effectiveness.
- Educators gain insights that help them identify students who are ready for advanced high school coursework and college courses.

## Intended Outcomes

The measurable outcomes of PreACT Secure include the following:

- Improved performance in academic areas identified as relative weaknesses
- Higher rates of success in advanced high school courses
- Higher ACT scores
- Higher enrollment and rates of success in college and career-training programs

### **1.4 Code of Fair Testing Practices in Education and Code of Professional Responsibilities in Educational Measurement**

Since the publication of the original edition in 1988, ACT has endorsed the *Code of Fair Testing Practices in Education* (Joint Committee on Testing Practices, 2004), a statement of the obligations to test takers of those who develop, administer, or use educational tests and test data. The development of the *Code* was sponsored by a joint committee of the American Association for Counseling and Development, the Association for Measurement and Evaluation

in Counseling and Development, the American Educational Research Association, the American Psychological Association, the American Speech-Language-Hearing Association, and the National Council on Measurement in Education to advance, in the public interest, the quality of testing practices.

The *Code* sets forth fairness criteria in four areas: developing and selecting appropriate tests, administering and scoring tests, reporting and interpreting test results, and informing test takers. Separate standards are provided for test developers and test users in each of these four areas.

ACT's endorsement of the *Code* represents a commitment to vigorously safeguarding the rights of individuals participating in its testing programs. ACT employs an ongoing review process whereby each of its testing programs is routinely reviewed to ensure that it upholds the standards outlined in the *Code* for appropriate test development practice and test use.

Similarly, ACT endorses and is committed to complying with the *Code of Professional Responsibilities in Educational Measurement* (NCME Ad Hoc Committee on the Development of a Code of Ethics, 1995), a statement of professional responsibilities for those who develop assessments; market and sell assessments; select assessments; administer assessments; interpret, use, and communicate assessment results; educate about assessment; and evaluate programs and conduct research on assessments.

A copy of each code may be obtained free of charge from

## 1.5 Test Preparation

Awareness of and exposure to an assessment prior to taking it is important for students to feel comfortable and confident. ACT offers a variety of free and affordable test preparation solutions for students, parents, and educators. Although these resources are designed for the ACT, they are also appropriate for students preparing for PreACT Secure.

- **ACT Question of the Day.** We post a daily test question to provide students with an opportunity for quick daily practice. Students and teachers can opt to receive a weekly email reviewing the questions posted that week.
- **Preparing for the ACT Test or Preparación Para el Examen ACT.** This booklet includes a full-length practice test, test-taking strategies, and information on what to expect on test day. This publication is available in English and Spanish and is free to download:
  - <http://www.act.org/content/dam/act/unsecured/documents/Preparing-for-the-ACT.pdf>

- <http://www.act.org/content/dam/act/unsecured/documents/Preparing-for-the-ACT-Spanish.pdf>
- **Online Familiarity Assessment.** A full-length ACT practice test is available in our simulated online testing environment. Students may also access both timed and untimed practice tests for each ACT section test. Students may access each of the section tests as often as they wish in order to become comfortable with the testing.
- **Alternate Assessment Format Samples.** Students who will test with alternate formats of the assessment can prepare by practicing with one of our alternate format samples. Full-length ACT practice tests are available in braille, large print, audio, and reader's scripts at no cost to the school.

# Chapter 2

## PreACT Secure Test Development

### 2.1 Overview

This chapter describes the process ACT uses to develop tests (including the National Curriculum Survey), along with item and form development procedures. It includes brief overviews of content and bias review processes and of the statistical criteria for form assembly and selection of operational items. This chapter also provides a high-level description of PreACT Secure scoring procedures, including descriptions of additional scores and indicators.

### 2.2 Description of PreACT Secure

PreACT Secure gives students practice for the ACT test and empowers them, their parents, and educators with valuable insights. The experience of taking the PreACT Secure test, combined with rigorous high school coursework, will help students perform their best when they take the ACT.

The ACT and PreACT Secure have a common purpose—to support students at key decision points in their academic preparation and planning. Both tests provide information helpful to educators guiding students through these important educational and career decisions.

The ACT and PreACT Secure English, math, reading, and science tests are designed with developmentally articulated test specifications, ensuring that the content follows a logical developmental sequence across the high school experience. They also share common item formats and follow consistent reporting procedures.

Despite having different score ranges due to a HOSS (highest obtainable scale score) imposed on the PreACT Secure, with a range of 1–35, and the ACT, with a range of 1–36, both assessments are on the same score scale. This allows comparison of a student's scores on the two assessments. A score increase (either Composite or any section test) from PreACT Secure to the ACT can be interpreted as growth in academic achievement.

Content specifications describing the knowledge and skills to be measured by PreACT Secure were determined through a detailed analysis of feedback from current high school and postsecondary teachers via the ACT® National Curriculum Survey®, as well as student data from the ACT and performance in postsecondary courses. These empirical data are used to continually verify that the PreACT Secure test is measuring the knowledge and skills required for postsecondary and career success.

### 2.3 The ACT National Curriculum Survey

Every few years, ACT conducts the ACT National Curriculum Survey, which assesses educational practices and college and career readiness expectations. ACT surveys thousands of K–12 teachers and college instructors in English/writing, mathematics, reading, and science,

as well as a national cross-section of workforce supervisors and employees, to determine which skills and knowledge in these subjects are being taught at each grade level and which skills and knowledge are considered essential for college and career readiness.

The survey also includes questions about which skills from the ACT<sup>®</sup> Holistic Framework<sup>®</sup> are essential to college and career success. The Holistic Framework is a research-based framework that integrates behavioral skills, education and career navigation skills, and dimensions such as core academic skills and cross-cutting capabilities.

ACT uses the results of the ACT National Curriculum Survey to guide the development of ACT assessment solutions, including the ACT test, PreACT, PreACT Secure, and ACT<sup>®</sup> WorkKeys<sup>®</sup>. ACT conducts the survey to ensure that its assessments measure the knowledge and skills that instructors of credit-bearing first-year college courses identify as important for success in each content area or that workforce supervisors identify as important for readiness for targeted workforce training and success on the job.

ACT makes the results of each ACT National Curriculum Survey public to help education and workforce stakeholders make more informed decisions about the skills students need to be successful in postsecondary education and the workplace.

### ***The Purpose of the ACT National Curriculum Survey***

The ACT National Curriculum Survey directly informs the test blueprint for the assessments. Results from the assessments are used to validate ACT's College and Career Readiness Standards as well as its College and Career Readiness Benchmarks.

Equally important is predictive validity. Does the test accurately and reliably predict performance? Constant monitoring allows ACT to ensure that the answer is "yes."

ACT periodically uses findings from the ACT National Curriculum Survey to monitor the test blueprints. This process ensures that the assessments always measure not only what is being taught in schools around the country, but also what demonstrably matters most for college and career readiness. To maintain relevancy and currency, it is important that assessments are constructed using up-to-date evidence of what matters most.

The science behind ACT assessments—the evidence base and ongoing research—is critical to answering the key question of what matters most in college and career readiness. The ACT National Curriculum Survey represents ACT's commitment to:

- use evidence and research to develop and validate ACT standards, assessments, and benchmarks;
- maintain a robust research agenda to report on key educational metrics (*The Condition of College and Career Readiness*, *Enrollment Management Trends Report*, *The Reality of College Readiness*, and *The Condition of STEM*); and
- develop assessments, reports, and interventions that will help individuals navigate their personal path to success along a kindergarten-through-career continuum.

As a nonprofit educational research organization, ACT uses these principles to drive the development and continuous improvement of ACT’s education and workplace solutions, as well as the research agenda associated with them, thereby enabling ACT to fulfill its mission of helping all individuals achieve education and workplace success.

### ***Survey Sample and Process***

For the 2020 ACT National Curriculum Survey, ACT sent out online surveys via various print and electronic methods (e.g., advertisements, email, social media) and invited participation from educators at the early elementary school, late elementary school, middle school, high school, and college levels who teach courses in English and writing, mathematics, reading (including English language arts and social studies), and science (including biology, chemistry, physics, and Earth/space science) in public and private institutions across the United States. ACT also invited participation from supervisors and employees at a large variety of businesses. Table 2.1 gives the numbers of survey respondents in each area.

**Table 2.1. ACT National Curriculum Survey 2020 Respondents**

<b>Area</b>	<b>Number of Respondents</b>
Early Elementary School	1,214
Late Elementary School	1,213
Middle School	1,623
High School	1,619
K–12 Administrators	405
College Instructors	2,883
Workforce Supervisors	405
Workforce Employees	406
<b>Total</b>	<b>9,768</b>

Education participants were asked to rate discrete content knowledge and skills with respect to how important each is to student success in the content area. Specifically, K–12 teachers were asked to rate the importance of each content or skill in a given class they teach, while college instructors were asked to rate the importance of each content or skill as a prerequisite to success in a given class they teach.

ACT also asked the K–12 teachers to indicate whether they teach particular content knowledge or skills and, if so, whether they teach this material as a standard part of their course or as part of a review of material that should have been learned earlier. Some education participants were also asked other content-related questions, depending on the grade level they teach.

Workforce participants were asked to rate discrete skills with respect to how important each is to entry-level success in the workplace. ACT also asked workforce participants to indicate how often employees in their workplace use each of these skills on the job.

Finally, ACT asked all participants questions relevant to current education policy issues (e.g., assessments, technology, standards, student characteristics, and obstacles to success). These

results are discussed in the companion report *ACT National Curriculum Survey 2020* ([www.act.org/research](http://www.act.org/research)).

Because some content areas were surveyed in larger numbers than others, the values displayed in educational-level totals were averaged across English language arts, mathematics, and science. This ensured that, in these results, no one content area would have more influence than another.

## **2.4 Test Development Procedures**

### **2.4.1 Review of Test Specifications**

Two major types of test specifications are used in developing PreACT Secure tests: content specifications and statistical specifications.

#### **Content Specifications**

Content specifications for PreACT Secure tests were informed by the curricular analysis discussed previously. While care is taken to ensure that the basic structure of PreACT Secure tests remains the same from year to year so that the scale scores are comparable, the specific characteristics of the test items used in each reporting category are reviewed regularly. Subject-matter experts review the new test forms to verify both their content accuracy and the match between the test content and the content specifications.

#### **Statistical Specifications**

Statistical specifications for the tests indicate the level of difficulty (proportion correct, average IRT  $b$ -parameter value) and minimum acceptable level of discrimination (biserial correlation, minimum IRT  $a$ -parameter values) of the test items to be used.

The tests are constructed to have a mean item difficulty that is somewhat easier than a typical ACT form in terms of average IRT  $b$ -parameter value and overall test characteristic curves. Items selected to be administered on the PreACT Secure test have a wide distribution of item difficulties so that the tests will effectively differentiate among students who vary widely in their level of achievement.

### **2.4.2 Selection of Item Writers**

The item writers for PreACT Secure are ACT staff and outside contractors who specialize in the disciplines measured by ACT tests. Most have experience in teaching at various levels, from high school to university, and at a variety of institutions, from small private schools to large public institutions. ACT makes every attempt to include item writers who represent the diversity of the population of the United States with respect to ethnic background, gender, and geographic location.

Before being asked to write items for ACT, potential item writer contractors (individuals and groups) are required to submit a sample set of materials for review. Each item writer receives an item writer's guide specific to the content area. The guides include examples of items and

provide item writers with the test specifications and ACT's requirements for content and style. They also provide specifications for fair portrayal of all groups of individuals, including use of gender-neutral language, balanced representation of race and ethnicity, and avoidance of subject matter that may be unfamiliar to members of certain groups.

ACT staff evaluate each sample set submitted by a potential item writer. Based on that evaluation, they decide whether to contract with the item writer.

Each item writer under contract is given an assignment to produce a small number of items in the content area they are qualified for. The small size of the assignment ensures a diversity of material and maintains the security of the testing program, since any item writer will know only a small proportion of the items produced. Item writers work closely with ACT content specialists, who help them produce items of high quality that meet the test specifications.

### ***2.4.3 Item-Writing Assignments***

Item-writing assignments are driven by the test blueprint and item pool analyses with the goal of attaining a wide range of high-quality items for the knowledge, skills, and abilities measured in each test. A typical assignment includes the evidenced-based item template and focuses on a skill statement the item needs to assess. Included in each template is a set of evidence statements the item(s) must elicit.

Assignments are made available to qualified item writers through the ACT item authoring system. This system also contains item metadata, comments from reviewers, and item quality metrics. The information in the system can be connected to the template through the assignment.

### ***2.4.4 Item Construction***

Item writers must create items that are psychometrically sound and meet the test blueprint. Many items must be constructed because many items, even those written by experienced item writers, fail to meet ACT's standards.

Each item writer submits a set of items, called a unit, in a given content area. Most math test items are discrete (not passage based), though some items may belong to a set of several items (e.g., several items based on the same paragraph or chart). All items on the English and reading tests are related to prose passages. All items on the science test are related to passages or other stimulus material, such as graphs and tables.

### ***2.4.5 Review of Items***

After an item (or set of items) is written, it is reviewed several times by ACT staff to verify that it meets all of ACT's standards. It is edited to meet ACT's specifications for content accuracy, word count, item classification, item format, and language. During the review and editing process, all test materials are reviewed for fair portrayal and balanced representation of social groups and for gender-neutral language.

After internal item reviews are completed, ACT invites external reviewers with knowledge and experience in those content areas, including practicing teachers from each grade level, to participate in refining items and verifying they are sampling constructs accordingly. Every item is independently reviewed by four to six subject matter experts from across the United States, each of whom has extensive experience with students at or around the grades the items are intended to assess. During the external content review, items are evaluated for content accuracy, item format, and the effectiveness of language in terms of leveling, precision, and fairness.

### **Bias, Sensitivity, Fairness, Accessibility Reviews**

To verify that all items delivered to students are fair, unbiased, and accessible, we conduct external fairness reviews for all items prior to pretesting and for entire test forms before they become operational.

The external fairness review panel consists of experts in diverse educational areas who have experience working with diverse populations. Educators from appropriate grade levels and content areas participate and actively give feedback. The fairness panel reviews items to help verify fairness to all students and to ensure that all items are free of bias or insensitivity. All comments are reviewed, and appropriate changes are made. ACT selects reviewers in such a way that no one state is overrepresented, because stakeholders count on national representation to maintain the comparability of test forms and scores.

### **2.4.6 Embedded Field Tests**

Sets of items judged as acceptable following the review process are then embedded in test forms and field-tested with representative samples of students. Each test section in a test form contains a set of embedded field test (EFT) items. Different sets of EFT items are spiraled into each test form.

EFT items do not contribute to a student's total reported test section score. EFT items are designed to be indistinguishable from scored items (that is, the items that contribute to the reported score). By juxtaposing EFT items with scored items, it is expected that students will invest the same level of effort when answering both types of items. The time limit for each test section permits most students to answer all scored and EFT items.

### **EFT Item Analysis**

EFT items are analyzed using classical test theory (CTT) and item response theory (IRT).

When CTT is used, for a given set of EFT items, the sample is divided into low-, medium-, and high-performing groups based on the individuals' total scores in the same subject test section. The cutoff scores for the three groups are the 27th and the 73rd percentile points in the distribution of those scores. These percentile points maximize the critical ratio of the difference between the mean scores of the upper and lower groups, assuming that the standard error of measurement in each group is the same and that the scores for the entire examinee population

are normally distributed (Millman & Greene, 1989). For each group, the proportion of students who chose the correct answer to each EFT item is computed, as well as the proportion of students who chose each of the incorrect answers. Biserial and point-biserial correlation coefficients of each EFT item are also computed.

When IRT is used, EFT items are calibrated using the 3-parameter logistic (3PL) IRT model (Birnbaum, 1968). Three parameters are estimated for each item: the discrimination parameter, the difficulty parameter, and the pseudo-chance parameter. The estimated parameters are then transformed to the same scale as all previously calibrated items using the Stocking-Lord method (Stocking & Lord, 1983).

Item analyses identify statistically effective test items. Items are eliminated or revised for future field testing if they are too difficult or too easy or if they fail to discriminate between students of high and low educational achievement as measured by their corresponding test scores. The biserial and point-biserial correlation coefficients, as well as the differences between proportions of students answering the item correctly in each of the three groups, are used as indices of the discriminating power of the EFT items when CTT is used.

Differential item functioning (DIF) analysis procedures are also conducted on the EFT items. DIF can be described as a statistically significant difference between the probability of a specific population group (the focal group) answering the item correctly and a comparison population group (the reference group) answering correctly when comparing students in the two groups who have similar levels of achievement with respect to the content being tested. Some items flagged for DIF are reviewed by a diverse panel of external fairness reviewers.

Each EFT item is reviewed following the item analysis. To identify possible problems, ACT staff members scrutinize items flagged for statistical reasons. In some cases, items are revised and undergo further review. The review process also provides feedback that helps to improve the quality of items in the future.

#### ***2.4.7 Assembly of New Forms***

EFT items that are judged acceptable following the item analysis and subsequent review are placed in an item pool. Preliminary forms of PreACT Secure tests are constructed using items from this pool that match the content and statistical specifications for the tests.

#### ***2.4.8 Content and Fairness Review of Test Forms***

The preliminary versions of the test forms are subjected to several reviews to ensure that the items are accurate and that the overall test forms are fair and conform to good test-construction practice. The first review is performed by ACT staff. Items are checked for content accuracy and conformity to ACT style. Items are also reviewed to ensure that they are free of clues that could allow test-wise students to answer the item correctly even though they lack the required skills or subject-area knowledge.

The preliminary versions of the test forms are then submitted to content and fairness experts for external review before the operational administration of the test forms. These experts are different individuals from those consulted for the content and fairness reviews of EFT items but are drawn from the same populations of curriculum and education specialists and perform the same types of reviews described in [Section 2.4.5](#).

Two panels—a content review panel and a fairness review panel—are provided the test forms for review. The content review panel consists of high school teachers, curriculum specialists, and college and university faculty members. This panel reviews the forms for content accuracy, educational importance, and grade-level appropriateness. The fairness review panel consists of experts in diverse areas of education, with a balanced representation of genders and experience working with diverse populations. This panel reviews the forms to help ensure fairness to all examinees.

After the panels complete their reviews, ACT summarizes the results. All comments from the consultants are reviewed by ACT staff members, and appropriate changes are made to the test forms. Whenever significant changes are made, items and/or passages are replaced and are again reviewed by the appropriate consultants and by ACT staff. If no further changes are needed, the test forms are published.

## **2.5 PreACT Secure Scoring Procedures**

The raw score for each of the PreACT Secure tests is equivalent to the number of questions answered correctly. It is converted to a scale score, which is discussed further in [Chapter 6](#).

The Composite score is the average of the four scale scores. The Composite score is rounded to the nearest whole number (0.5 rounds up) and has a minimum score of 1 and a maximum of 35.

### **2.5.1 Additional Scores and Indicators**

Beginning with the September 2015 ACT test, ACT began reporting Science, Technology, Engineering, and Math (STEM) scores, a combination of students' math and science scores. Also introduced at that time was the Progress Toward the ACT National Career Readiness Certificate Indicator. These scores are also reported for PreACT 8/9, PreACT, and PreACT Secure.

### **2.5.2 The STEM Score**

The STEM score is the average of the math and science scale scores rounded to the nearest integer (fractions of 0.5 or greater round up). Only students who receive scores for both tests receive a STEM score.

### **2.5.3 Progress Toward the ACT National Career Readiness Certificate (NCRC) Indicator**

The Progress Toward the ACT NCRC Indicator is based on students' PreACT Secure Composite scores. It provides an estimate of students' likely performance on the ACT® WorkKeys® National Career Readiness Certificate® (NCRC®). The ACT NCRC is an assessment-based credential that certifies foundational work skills important for job success across industries and occupations. The ACT NCRC is based on the results of three ACT WorkKeys Assessments: Applied Math, Graphic Literacy, and Workplace Documents. Scores on these assessments determine the certificate level—no certificate, Bronze, Silver, Gold, or Platinum—an individual can earn. The ACT NCRC gives individuals evidence that they possess the skills employers deem essential to workplace success. More information about the ACT NCRC can be found at <http://workforce.act.org/credential>. More details on the ACT test scores and indicators can be found in [Chapter 7](#).

## **2.6 PreACT Secure Score Scales**

Scale scores are reported for PreACT Secure English, math, reading, and science tests. Scale scores are also reported for the Composite score (calculated by rounding the unweighted average of the four test scores) and the STEM score (calculated by rounding the unweighted average of the math and science scale scores). Rounding is to the nearest integer, with fractions of 0.5 or greater being rounded up. The range of all PreACT Secure scale scores is 1 to 35.

PreACT Secure scale scores can be compared directly to the ACT's 1-to-36 score scale for each of the corresponding scale scores (PreACT Secure English to ACT English, PreACT Secure STEM to ACT STEM, etc.). The correspondence between the PreACT Secure and ACT score scales is the result of obtaining a common scale for the two assessments. PreACT Secure items are calibrated and placed onto the ACT item pool scale, and an IRT post-equating procedure is used to obtain PreACT Secure scale scores so that those scores are on the same scale as ACT scale scores. The IRT equating procedure is used to derive raw-to-scale score conversion tables for PreACT Secure. The mean PreACT Secure and ACT scale scores are expected to be close for any group of examinees taking both tests at the same time. The variance of PreACT Secure and ACT scale scores for any given group of examinees, however, will not be equal, as the ACT tests are longer and more reliable than their PreACT Secure counterparts. Hence, the standard error of measurement is expected to be greater on PreACT Secure.

PreACT Secure score scales have a maximum of 35. The rationale for setting the maximum scale score on PreACT Secure tests at 35, rather than at 36 as it is for the ACT tests, is that PreACT Secure is intended to be a shorter and less difficult version of the ACT. Thus, it is easier to obtain a perfect score (all correct) on PreACT Secure than it is on the ACT. Consequently, it was decided to cap PreACT Secure scores at a lower value.

# Chapter 3

## PreACT Secure Test Specifications

### 3.1 Overview

This chapter describes the content blueprints for each of the four multiple-choice PreACT® Secure™ tests.

### 3.2 English Test

#### *3.2.1 Description of the English Test*

The PreACT Secure English test has 48 items (36 scored items and 12 field-test items) and a 35-minute time limit. The test places the student in the position of a writer who is revising and editing a text and measures a student's understanding of the following: the conventions of standard written English (grammar, usage, and mechanics), production of writing (topic development, organization, unity, and cohesion), and knowledge of language (word choice, style, and tone). The test consists of three passages, each accompanied by a sequence of multiple-choice items. Different passage types are employed to provide a variety of rhetorical situations. Students must use the rich context of the passage to make editorial choices, demonstrating their understanding of writing strategies and conventions. Passages are chosen not only for their appropriateness in assessing writing and language skills, but also to reflect students' interests and experiences. Spelling and the rote recall of the rules of grammar are not tested.

Some items refer to underlined or highlighted portions of the passage and offer several alternatives to the designated portion. These items often include making no change to the designated portion of the passage as one of the possible responses. Some items are identified by a number in a box or by a highlighted asterisk. These items ask about a section of the passage or about the passage as a whole. Some items appear at the end of the item set and are accompanied by instructions noting that the questions ask about the passage as a whole. The student must decide which choice best answers each question.

#### **Cognitive Complexity and Depth of Knowledge (DOK)**

Depth of Knowledge (DOK; Webb, 2002) is a rough-grained, judgment-based measure of a test item's cognitive complexity that is used in many educational contexts. The PreACT Secure English test assesses skills across a range of cognitive complexities using items at DOK Levels 1, 2, and 3. All English items are classified by ACT content experts according to the level descriptions in Table 3.1.

Table 3.1. DOK Level Descriptions for English

Depth of Knowledge Level	Description
DOK1	Requires the recall of information, such as a fact, term, definition, or simple procedure. Requires students to demonstrate a rote response or perform a simple procedure.
DOK2	Requires mental processing that goes beyond recalling or reproducing an answer. Students must make some decisions about how to approach a problem.
DOK3	Requires planning, thinking, explaining, justifying, using evidence, conjecturing, and postulating.

### 3.2.2 English Scores and Reporting Categories

Four scores are reported: a total test score based on the 36 scored items, and three reporting category scores based on specific knowledge and skills. The three reporting categories are Production of Writing, Knowledge of Language, and Conventions of Standard English. These reporting categories are subdivided into six elements, each of which targets an aspect of effective writing. A brief description of the reporting categories is given below, followed by a table showing the approximate percentage of test items in each reporting category.

#### Production of Writing

Students develop a topic effectively by applying their understanding of the rhetorical purpose and focus of a piece of writing. They use various strategies to achieve logical organization, topical unity, and cohesion.

- *Topic Development*  
Students demonstrate understanding and control of the rhetorical aspects of texts by identifying the functions of parts of texts, determining whether a text or part of a text has accomplished a purpose, and evaluating the relevance of material in terms of a text's focus.
- *Organization, Unity, and Cohesion*  
Students use various strategies to ensure that a text is logically organized, flows smoothly, and has an effective introduction and conclusion.

#### Knowledge of Language

Students demonstrate effective language use by ensuring precision and concision in word choice and maintaining consistency in style and tone.

#### Conventions of Standard English

Students apply their understanding of the conventions of standard English grammar, usage, and mechanics to revise and edit text.

- *Sentence Structure and Formation*

Students apply an understanding of sentence structure and formation, including understanding the placement of modifiers and relationships between and among clauses.

- *Usage*

Students edit text to conform to standard English usage.

- *Punctuation*

Students edit text to conform to standard English punctuation.

### 3.2.3 English Test Blueprints

Table 3.2 shows the current target distribution of scored items across reporting categories on each PreACT Secure English test form.

**Table 3.2. Specification Ranges by Reporting Category for English**

Reporting Category	Number of Items	Percentage of Test
Production of Writing	10–12	28%–33%
Knowledge of Language	5–7	14%–19%
Conventions of Standard English	18–20	50%–56%
<b>Scored Total</b>	<b>36</b>	<b>100%</b>

## 3.3 Math Test

### 3.3.1 Description of the Math Test

The PreACT Secure math test has 38 items (33 scored items and five field-test items) and a 45-minute time limit. The test considers the whole of a student’s mathematical development, covering topics typically taught up through the beginning of Grade 12 in U.S. schools and focusing on the prerequisite knowledge and skills that are important for success in college math courses and career training programs. The domain is divided into Preparing for Higher Math (PHM) and Integrating Essential Skills (IES). The PreACT Secure math test weights Grade 8, 9, and 10 skills more heavily than the ACT math test, but students see a wide range of questions like those on the ACT math test.

The math construct requires making sense of problems and context, representing relationships mathematically, accessing appropriate mathematical knowledge from memory, incorporating given information, modeling, performing mathematical computations and manipulations, interpreting, applying reasoning skills, justifying, making decisions based on the math, and appropriately managing the solution process. The test emphasizes quantitative reasoning and application over extensive computation or the memorization of complex formulas. Items focus

on what students can do with the math they have learned, which encompasses not only mathematical content but also mathematical practices.

Some degree of computational fluency is required. A calculator is encouraged but not required. Items are designed so that a sophisticated calculator does not provide a significant advantage over a four-function calculator, and so that all items can be done without a calculator in a reasonable amount of time.

Each item has five response options, and students are instructed to choose the correct option. The test contains problems ranging from easy to very challenging so that readiness levels can be reliably reported for students with different degrees of preparedness. Extended accessibility supports provide for fair and comparable math scores across a range of circumstances. More information on accessibility can be found in [Chapter 4](#).

### **Cognitive Complexity and Depth of Knowledge (DOK)**

The PreACT Secure math test assesses skills that vary in cognitive complexity using items at DOK Levels 1, 2, and 3. ACT content experts consider how most well-prepared Grade 10 students will approach each item, and they then classify each item according to the level descriptions in Table 3.3.

**Table 3.3. DOK Level Descriptions for Math**

Depth of Knowledge Level	Description
DOK1	Requires the recall of information, such as a fact, term, definition, or simple procedure. Requires students to demonstrate a rote response or perform a simple procedure.
DOK2	Requires mental processing that goes beyond recalling or reproducing an answer. Students must make some decisions about how to approach a problem.
DOK3	Requires planning, thinking, explaining, justifying, using evidence, conjecturing, and postulating. The cognitive demands are complex and abstract.

### **3.3.2 Math Scores and Reporting Categories**

Nine scores are reported for the PreACT Secure math test: a total test score based on the 33 scored items, and eight reporting category scores based on different domains of mathematical knowledge, skills, and practices. The test is first divided into the Preparing for Higher Math (PHM) and Integrating Essential Skills (IES) reporting categories. The PHM score is then divided into separate scores for Number & Quantity, Algebra, Functions, Geometry, and Statistics & Probability. A crosscutting reporting category, Modeling, draws upon items from all the other categories to give a measure of producing, interpreting, understanding, evaluating, and improving models. PreACT Secure score reports provide the percentage of correctly answered items in each reporting category.

The total test score is reported on the PreACT Secure math scale, which ranges from 1 to 35. Properties of this scale are given in [Chapter 6](#). The total math score is averaged with the total science score to determine the STEM (science, technology, engineering, and mathematics) score, which is related to success in postsecondary STEM courses.

### **Preparing for Higher Math**

This reporting category captures the more recent math that students are learning. This category is divided into the following five subcategories.

#### *Number & Quantity*

Students demonstrate an understanding of and fluency with rational numbers and the four basic operations, and they work with irrational numbers, including approximating irrational numbers with rational numbers. They use properties of the real number system. They show their knowledge of complex numbers, compute in this system, and work with the properties of complex numbers. They use vectors and matrices and view them as number systems with properties, operations, and applications.

#### *Algebra*

Students manipulate and evaluate expressions involving integer exponents, square and cube roots, and scientific notation. They solve linear equations and make connections between their graphs and proportional relationships. They use their understanding of linear equations to make sense of other kinds of equations and inequalities: what their graphs look like, how to solve them, and what kinds of applications they have for modeling. Students use expressions to solve problems, and they show an understanding of solving equations. They demonstrate extended proficiency with equations by using quadratic, polynomial, rational, and radical equations as well as systems of equations. They create expressions, equations, and inequalities to represent problems and constraints. They see rational expressions as systems analogous to rational numbers, apply the binomial theorem, and solve simple matrix equations that represent systems of linear equations.

#### *Functions*

Students demonstrate an understanding of what a function is and what its characteristics are. They can define functions using two variables or function notation. Understanding the general properties of functions equips students to solve problems using new functions they create. Functions provide a framework for modeling real-world phenomena, and students interpret the characteristics of functions in the context of a problem. Students work with functions that have no equation and functions that follow the pattern of an equation. They reason with particular families of functions—like linear, quadratic, and exponential—by looking at rates of change, algebraic properties, and connections to graphs and tables and by applying these functions in modeling situations. They also work with a range of functions, like those defined in terms of square roots, cube roots, polynomials, exponentials, and logarithms, as well as piecewise-defined functions. They graph rational functions and demonstrate knowledge of asymptotes.

Students have seen shifts in graphs due to parameter changes, but now they demonstrate a unified understanding of translations and scaling through forms such as  $f(x - c)$ ,  $f(x) + c$ ,  $af(x)$ , and  $f(-ax)$ . They compose functions and use inverse functions to solve equations with more than one solution. Students connect the trigonometry of right triangles to the unit circle to make trigonometric functions. They use these functions to model periodic behavior. They apply the algebraic properties of trigonometric functions, such as angle addition properties.

### *Geometry*

Students show an understanding of congruence and similarity using transformations like translations and dilations. Students investigate the relationships between the angles formed by parallel lines and a transversal. They model and solve problems with geometric objects. Students find values such as the area of a circle and the volume of cylinders, pyramids, and cones. They demonstrate an understanding of trigonometric ratios as functions of angles, and they solve right-triangle problems using these ratios and the Pythagorean theorem. In the coordinate plane, students derive conditions for parallel and perpendicular lines, split a line segment into pieces with a given ratio of lengths, find areas, and develop equations for circles and parabolas.

Students use trigonometry to compute the area of a triangle, and they apply the law of sines and the law of cosines to answer questions about non-right triangles. They derive equations for ellipses and hyperbolas. Students show an understanding of Cavalieri's principle when using formulas such as the formula for the volume of a sphere.

### *Statistics & Probability*

Students identify patterns of association between two quantities by analyzing scatterplots and two-way tables. They fit linear models to data sets and use the models to solve problems.

Students demonstrate their knowledge of the role of randomness in sample surveys, experiments, and observational studies. They use data to estimate a population mean or proportion and make informal inferences based on their judgment of likelihood. They compare qualities of research reports based on data and use simulation data to make estimates and judgments.

Students demonstrate an understanding of statistical independence. They relate the sample space to events defined in terms of "and," "or," and "not," and they calculate probabilities using empirical results, independence assumptions, and the ideas of conditional probability. Students understand the multiplicative rule for conditional probability and apply permutations and combinations as tools for counting. They model a sample space with a random variable by giving a numerical value to each event. Students apply expected value and probability to help inform their decisions.

### **Integrating Essential Skills**

This reporting category focuses on whether students can put together their knowledge and skills to solve problems of moderate to high complexity. Topics include rate and percentage;

proportional reasoning; units of measure; solving problems with rational numbers; constructing and solving simple equations; scale drawings; cross sections; area, perimeter, circumference, surface area, and volume; simple measures of center and spread; probability; and random sampling.

In addition to learning more content as they progress through their studies, students should also grow in sophistication, accumulating and applying skills in higher-order contexts. Therefore, students should be able to solve problems of increasing complexity, combine skills in longer chains of steps, apply skills in more varied contexts, understand more connections, and increase fluency. In order to assess whether students have had appropriate growth, the items in this reporting category are at DOK Levels 2 and 3.

### **Modeling**

Modeling uses math to represent, through a model, an analysis of an empirical situation. Models often help us predict or understand the actual. However, sometimes knowledge of the actual helps us understand the model, such as when addition is introduced to students as a model of combining two groups. The Modeling reporting category represents all items that involve producing, interpreting, understanding, evaluating, and improving models. Each modeling item is also counted in the other appropriate reporting categories. Thus, the Modeling reporting category is an overall measure of how well a student uses modeling skills across mathematical topics.

#### **3.3.3 Calculator Policy**

Students are encouraged to bring a calculator they are familiar with and can use fluently. Most four-function, scientific, or graphing calculators are permitted. Built-in computer algebra systems are not allowed because they could interfere with the construct, specifically understanding and implementing the solutions of various types of equations and inequalities. Students must remove certain kinds of programs from their calculators. In addition, some calculator features must be turned off for security reasons or to prevent disruptions during testing. The ACT calculator policy is available on the [ACT website](#). A graphing calculator is available in the online testing application in the mathematics subject-level test.

#### **3.3.4 Item Sets**

The math test may include an item set. An item set first presents information, including text, graphs, or other stimulus material, and then follows that information with a set of two to five items that each draw upon the given information. Items in the set (and across the form in general) are logically independent, meaning that getting the correct answer to one item does not depend upon getting the correct answer to another item.

#### **3.3.5 Math Test Blueprints**

Table 3.4 shows the current target distribution of scored items across reporting categories on each PreACT Secure math test form. Test construction also takes into account coverage and variety within each of the categories. The test includes PHM items at all three DOK levels (1, 2,

and 3). By contrast, it includes IES items only at Levels 2 and 3. This is because IES topics are more practiced and familiar and because putting these familiar skills to work in higher-complexity tasks is important for college readiness.

**Table 3.4. Specification Ranges by Reporting Category for Math**

Reporting Category	Number of Items	Percentage of Test
<b>Preparing for Higher Math</b>	21	64%
Number & Quantity	3–5	9%–15%
Algebra	4–6	12%–18%
Functions	4–6	12%–18%
Geometry	3–5	9%–15%
Statistics & Probability	3–5	9%–15%
<b>Integrating Essential Skills</b>	12	36%
<b>Modeling</b>	≥8	≥24%
<b>Scored Total</b>	<b>33</b>	<b>100%</b>

*Note.* Each item reported in Modeling is also reported in either Preparing for Higher Math (and the appropriate subcategory) or Integrating Essential Skills.

## 3.4 Reading Test

### 3.4.1 Description of the Reading Test

The PreACT Secure reading test has 33 items (25 scored items and 8 field-test items) and a 40-minute time limit. The test measures a student’s ability to read closely, reason about texts using evidence, and integrate information from multiple sources. It comprises three passage units, one of which may contain two shorter prose passages on the same topic. One of the passages is a literary narrative, and the other two are informational texts from the humanities, natural sciences, or social sciences. Passages are representative of the kinds of texts commonly encountered in high school and first-year college curricula. Each passage is preceded by a heading that identifies the passage type (e.g., literary narrative) and names the author; it may also contain important background information that helps in understanding the passage.

Each passage is associated with a set of multiple-choice items. The items focus on the mutually supportive skills that readers apply when studying written materials across a range of subject areas. Specifically, items ask students to determine main ideas; locate and interpret significant details; understand sequences of events; make comparisons; comprehend cause-effect relationships; determine the meaning of context-dependent words, phrases, and statements; draw generalizations; analyze the author’s or narrator’s voice or method; analyze claims and evidence in arguments; and integrate information from multiple related texts. Items do not test the rote recall of facts from outside the passage or the rules of formal logic, nor do they contain questions about vocabulary that can be answered without referring to the passage context.

## Cognitive Complexity and Depth of Knowledge (DOK)

The PreACT Secure reading test assesses skills across a range of cognitive complexities using items at DOK Levels 1, 2, and 3. All multiple-choice items are classified by ACT content experts according to the level descriptions in Table 3.5.

**Table 3.5. DOK Level Descriptions for Reading**

Depth of Knowledge Level	Description
DOK1	Requires the recall of information, such as a fact, term, definition, or simple procedure. Requires students to demonstrate a rote response or perform a simple procedure.
DOK2	Requires mental processing that goes beyond recalling or reproducing an answer. Students must make some decisions about how to approach a problem.
DOK3	Requires planning, thinking, explaining, justifying, using evidence, conjecturing, and postulating.

### 3.4.2 Reading Scores and Reporting Categories

Four scores are reported: a total test score based on the 25 scored items, and three reporting category scores based on specific knowledge and skills. The three reporting categories are Key Ideas & Details, Craft & Structure, and Integration of Knowledge & Ideas. A description of each category is given below, followed by a table showing the approximate percentage of the test devoted to each reporting category.

#### Key Ideas & Details

Students read texts closely to determine central ideas and themes, summarize information and ideas accurately, understand relationships (including sequential, comparative, and cause-effect), and draw logical inferences and conclusions.

#### Craft & Structure

Students determine word and phrase meanings, analyze how an author uses word choice to achieve a rhetorical effect, analyze text structure, understand authorial purpose and perspective, and analyze points of view. They interpret the rhetorical effects of authorial decisions and differentiate between various perspectives and sources of information.

#### Integration of Knowledge & Ideas

Students understand authors' claims, differentiate between facts and opinions, and use evidence to make connections between different texts that are related by topic. Some items will require students to analyze how authors construct arguments and to evaluate reasoning and evidence from various sources.

### 3.4.3 Reading Test Blueprints

Table 3.6 shows the current target distribution of scored items across reporting categories on each PreACT reading test form.

**Table 3.6. Specification Ranges by Reporting Category for Reading**

Reporting Category	Number of Items	Percentage of Test
Key Ideas & Details	13–15	52%–60%
Craft & Structure	7–9	28%–36%
Integration of Knowledge & Ideas	3–4	12%–16%
<b>Scored Total</b>	<b>25</b>	<b>100%</b>

## 3.5 Science Test

### 3.5.1 Description of the Science Test

The PreACT Secure science test has 36 items (30 scored items and six field-test items) and a 35-minute time limit. The test measures the interpretation, analysis, evaluation, reasoning, and problem-solving skills required in the natural sciences. The content of the science test is drawn from the fields of biology, chemistry, physics, and Earth science/space science.

Students are assumed to have, or to be in the process of completing, a minimum of two years of introductory science, which the ACT<sup>®</sup> National Curriculum Survey<sup>®</sup> has identified as typically one year of biology and one year of physical science or Earth science. Thus, it is expected that students have learned the introductory content of biology, physical science, and Earth science; are familiar with the nature of scientific inquiry; and have been exposed to laboratory investigation.

The test presents several passages containing scientific information, each followed by a number of multiple-choice items. The scientific information is conveyed in one of three different formats: data representation (scientific graphs, tables, and diagrams), research summaries (descriptions and results of one or more related experiments), or conflicting viewpoints (two or more brief theoretical models that address the same scientific phenomenon but are inconsistent with one another).

#### **The Nature of the PreACT Secure Science Test: What Does It Measure?**

The PreACT Secure science test assesses science knowledge, skills, and practices across three domains: Interpretation of Data; Scientific Investigation; and Evaluation of Models, Inferences & Experimental Results.

These three domains, and the knowledge and skills encompassed by each domain, were derived from ACT's decades of empirical data and research on college and career readiness in science. The domains and their skills make up the ACT College and Career Readiness Standards for science, which link specific skills and knowledge to quantitatively determined

score ranges for the ACT science test and to the College and Career Readiness Benchmark in science, which is predictive of success in science at the postsecondary level. These three domains are also the reporting categories for the PreACT Secure science test (see Table 3.8). ACT also reviews science benchmarks and standards from state, national, and international standards documents (e.g., the Next Generation Science Standards) and monitors the impact of these documents on science curricula to ensure alignment and, when needed, to update the constructs of the test.

All items on the ACT science test are based on authentic scientific scenarios that are built around important scientific concepts, and they are designed to mirror the experiences of students and working scientists engaging in real science. The ACT science test focuses on multidimensional assessment (to measure three-dimensional learning in science) with items that require students to apply multiple domains. Some of the items require that students have discipline-specific content knowledge (e.g., knowledge specific to an introductory high school physical science or biology course), but all the items focus on science process skills. Research conducted by ACT on science curricula and instruction at the high school and postsecondary levels shows that, while having a fundamental understanding of disciplinary science concepts is important, being able to apply science practices and process skills to science content to solve problems is more strongly tied to college and career readiness in science. The ACT science test focuses on measuring the science skills and knowledge that are empirically tied to college and career readiness.

### **Cognitive Complexity and Depth of Knowledge (DOK)**

The PreACT Secure science test assesses at DOK Levels 1, 2, and 3, with almost all the items at Levels 2 and 3. Below is an example of how items on the PreACT Secure science test are classified by DOK. All multiple-choice items are classified by ACT content experts according to the level descriptions in Table 3.7.

**Table 3.7. DOK Level Descriptions for Science**

Depth of Knowledge Level	Description
DOK1	Requires locating, recalling, and/or reproducing information.
DOK2	Requires processing presented information and applying skills and concepts. Students typically must process one or two cognitive steps.
DOK3	Requires use of higher-order thinking, such as analysis and evaluation, and often requires using evidence to justify reasoning. Students must typically process multiple cognitive steps, and the overall tasks tend to be complex and abstract.

### ***3.5.2 Science Scores and Reporting Categories***

Four scores are reported: a total test score based on the 30 scored items, and three reporting category scores based on different domains of scientific knowledge, skills, and practices. The three reporting categories are Interpretation of Data; Scientific Investigation; and Evaluation of Models, Inferences & Experimental Results. A description of each reporting category is provided below, and the percentage of the test devoted to each reporting category is provided in Table 3.8. The overall test score is reported on the PreACT Secure science scale, which ranges from 1 to 35. This total science score is averaged with the total math score to determine the STEM score.

#### **Interpretation of Data**

Students manipulate and analyze scientific data presented in tables, graphs, and diagrams (e.g., recognizing trends in data, translating tabular data into graphs, interpolating and extrapolating, and reasoning mathematically).

#### **Scientific Investigation**

Students understand experimental tools, procedures, and design (e.g., identifying variables and controls) and compare, extend, and modify experiments (e.g., predicting the results of additional trials).

#### **Evaluation of Models, Inferences & Experimental Results**

Students judge the validity of scientific information and formulate conclusions and predictions based on that information (e.g., determining which explanation for a scientific phenomenon is supported by new findings).

### ***3.5.3 Science Test Blueprints***

Table 3.8 shows the current target distribution of scored items across reporting categories on each PreACT Secure science test form.

**Table 3.8. Specification Ranges by Reporting Category for Science**

<b>Reporting Category</b>	<b>Number of Items</b>	<b>Percentage of Test</b>
Interpretation of Data	6–12	20%–40%
Scientific Investigation	5–12	17%–40%
Evaluation of Models, Inferences & Experimental Results	6–12	20%–40%
<b>Scored Total</b>	<b>30</b>	<b>100%</b>

# Chapter 4

## Test Administration, Test Security, Accessibility, Accommodations, and Supports

### 4.1 Administering PreACT Secure

PreACT® Secure™ can be administered during certain limited windows during the spring semester of each school year. PreACT Secure implementation webinars and resources provide instruction for scheduling testing and ordering materials.

#### *Participation Procedures*

In January, WI DPI provided an organization file and performed the student data upload (SDU) to support the start of the administration cycle. Also, in January after the SDU, Test Coordinators began setting up online or paper testing, assigning accommodations and English learner (EL) supports, and verifying enrollment. Spring testing occurred March 20 - April 28, 2023, for both online and paper testing (accommodations only).

#### *Administration Schedule*

PreACT Secure is designed to be administered within a half day during school-supervised sessions. It takes 2 hours 35 minutes for the four test sections. A non-test section in which students may fill-in demographic information may be administered in a nonsecure supervised school setting on or before the test day. The four test sections must be administered in a single session on the designated test day unless a student is approved for multiday testing in their accommodations plan. Consult the [PreACT Secure Administration Manual](#) for information about makeup testing.

#### *PreACT Secure Support Materials*

PreACT Secure includes a coordinated set of support materials to help students, parents, guardians, teachers, counselors, and administrators understand the purposes of the program and the information provided.

- Implementation webinars and resources include links to online materials that provide information about PreACT Secure and help schools begin planning their administration.
- The *PreACT Secure Administration Manual* is designed for test coordinators and testing staff. The manual provides detailed instructions for planning and administering the non-test section and the test sections.
- The *Accessibility and Supports Guide for PreACT Secure* helps educational teams select appropriate accessibility supports and accommodations for their students to use during testing.
- Before testing, the test coordinator will designate each student as testing either online or on paper and as testing with standard time, with accommodations, or with EL supports.

Paper testing is only available for a limited number of accommodations (braille, large print, and reader's script).

- For online testing, all required test materials and tools are included in the TestNav portal. For students testing with accommodations or EL supports, additional tools will be available in the TestNav portal or at the test site to support the students.
- For paper testing, schools should order one package of test materials for each student testing with accommodations. Each package includes one standard test booklet, one alternate-format test (braille, large print, or reader's script), answer documents, and instruction booklets. Each shipment will also include necessary return materials.
- Student and school reports are available in ACT's Online Reporting system.
- Each student who takes PreACT Secure will have access to *Using Your PreACT Secure Results*, which includes information about interpreting the student report, planning for high school and beyond, exploring career possibilities, and building academic skills.
- Educators will have access to the *PreACT Secure Interpretive Guide for Student and Aggregate Reports*, which includes information for helping students understand their student reports and for interpreting the school aggregate reports (Student List Report, Educator Report, and Student Data File).
- The *ACT Online Reporting User Guide* is available to help testing staff use the Online Reporting system to retrieve score reports, analyze data, and create school-, district-, and state-level reports.

## 4.2 Test Security

To ensure the validity of PreACT Secure test score interpretations, the examinees, any individuals who have a role in administering the tests, and those who are otherwise involved in facilitating the testing process must strictly observe ACT's standardized testing policies and procedures, which may be supplemented by ACT from time to time with additional communications to testing staff.

Testing staff must protect the confidentiality of PreACT Secure test items and responses before, during, and after testing. Testing staff should be competent to undertake their roles and aware of their responsibilities, which include understanding ACT's test administration policies and procedures as well as acknowledging and avoiding conflicts of interest in their roles as test administrators for PreACT Secure.

Testing staff must be alert to activities that can compromise the fairness of the test and the validity of score interpretations. Such activities include, but are not limited to, the following:

- prohibited test-taking behavior, such as copying answers or using prohibited electronic devices during testing
- accessing questions before or after the test, taking photos, or making copies of test questions or test materials
- posting test questions on the internet
- test proctor or test administrator misconduct, such as providing questions or answers to examinees or permitting them to engage in prohibited conduct during testing

In addition to implementing security-related protocols, ACT may engage, at its discretion, additional test security practices designed to protect PreACT Secure test content and the validity of score interpretations.

### 4.3 Information Security

The ACT information security framework is based on the widely recognized ISO/IEC 27000 standard (International Organization for Standardization, 2017). This framework was selected because it covers a range of information security categories that comprehensively reflect the broad perspective ACT takes in safeguarding information assets. The following are categories covered by the framework and brief statements of their importance to ACT:

8. **Information Security Program Management.** This is overseen by the information security officer at ACT. The information security officer provides guidance and direction to the organization to ensure compliance with all relevant security-related regulations and requirements.
9. **Information Security Risk Management.** ACT uses the CIS Risk Assessment Method (CIS RAM) to identify, manage, and mitigate information security risks.
10. **Information Security & Data Privacy Policy.** ACT's Information Security & Data Privacy Policy, together with the supporting standards, emphasizes the importance of safeguarding information and data assets and sets a direction for doing so.
11. **Information and Technology Compliance.** The systems that store, maintain, and process information are designed to protect data at all stages. The security considerations surrounding ACT's systems include encryption, system security requirements, and logging and monitoring to verify that systems are operating within expected parameters.
12. **Business Continuity and Disaster Recovery.** ACT maintains a business continuity program designed to ensure that critical business operations will be maintained in the event of a disruption.
13. **Security Training and Awareness.** At ACT, information security is everyone's responsibility. All employees take annual information security awareness training on topics covered in the Information Security & Data Privacy Policy; additional training is received by the individuals within the organization who manage, coordinate, and implement specific information security objectives.

### 4.4 Accessibility, Accommodations, and Supports

Accessibility supports apply to all students and emphasize an individualized approach to implementing assessment practices for students with diverse needs. Different levels of support are needed by individual students so they can demonstrate what they know and can do. PreACT Secure permits the use of supports that will honor the skills and knowledge that the tests measure while removing construct-irrelevant barriers to student performance.

Although ACT designs the standardized testing experience to be the same for all students, ACT does afford language supports for English learners and accommodations for students with

diagnosed, documented disabilities in order to provide equitable access to the test without compromising the validity of the test results.

The four types of accessibility supports available for use with PreACT Secure are as follows:

- universal supports
- designated supports
- accommodations
- English learner supports

### ***Universal Supports***

Universal supports are accessibility aids made available to all students to foster greater inclusion in the experience of taking the standardized test. Universal supports are embedded into testing practices and platforms.

Universal supports embedded into PreACT Secure include the following:

- ability to use log-in tickets as scratch paper
- embedded calculator for the math test
- section directions available on demand
- ability to ask for clarification or repetition of verbal instructions
- ability to mark items for review
- highlighter
- ability to adjust color contrast
- magnification device/zoom
- answer eliminator
- answer masking tool

### ***Designated Supports***

Designated supports are adjustments to a test that are available to any student with an identified need. Typically, designated supports are adjustments to the testing environment that require advance planning to deliver. It is recommended that a consistent process be used to determine the supports each student needs. Designated supports for PreACT Secure include the following:

- assistive devices/technology
- food, drink, or medication for examinees with a medical need in the test room (does not include cell phones or other smart devices used to monitor medical conditions)
- frequent breaks that do not stop the testing clock
- noise buffers/earplugs
- permission to stand during testing
- personal aide
- service animal

- small group or one-to-one testing

### **Accommodations**

Accommodations are accessibility supports needed by relatively few students. Students who receive accommodations should have a documented disability and a formal educational plan—generally a current Individualized Education Program (IEP) or 504 plan—that indicates their individual needs. It is recommended that this plan be developed by an educational team that includes relevant school personnel, parents/guardians, and the student. Accommodations decisions are usually based on a formal evaluation of a student and of what the student needs to access instruction and assessments.

Successful and secure delivery of an accommodated standardized assessment often requires additional local individuals with specialized skills and knowledge. ACT recommends that students who will use accommodations on an assessment regularly use those same accommodations in an educational setting in order to become proficient with them.

Examples of accommodations include, but are not limited to, the following:

- timing (e.g., extra testing time, breaks as needed, multiday administration)
- presentation and formats (e.g., braille, text-to-speech, screen reader software, sign language interpreter)
- response and navigation (e.g., accessible calculator for math, brailled response, speech-to-text, scribe)
- setting and location (e.g., medical monitoring devices, background music, fidget device, personalized notification of time remaining)

A complete list of available accommodations is in the *Accessibility Supports Guide for PreACT Secure*.

### **English Learner Supports**

English learner (EL) supports are available for students who are not proficient in English. Designation as a student with limited English proficiency (LEP) follows the guidelines set by each individual state department of education. Such a designation is evidence of a need for EL supports. Generally, English language proficiency is measured using an English language proficiency (ELP) assessment.

Only the following EL supports are available for use on PreACT Secure:

- ACT-authorized bilingual dictionary
- translated test directions, provided by ACT
- one-and-one-half time, single day
- small-group testing

### ***Testing Students With Accommodations and English Learner Supports***

Accommodations and EL supports on PreACT Secure are limited to those that do not invalidate the test construct. Not all accommodations or EL supports provided in the classroom fall into this category.

A student's eligibility to take PreACT Secure with accommodations or EL supports is entirely at the discretion of school personnel. ACT recommends accommodations and EL supports selection be based on the student's current educational plan, medical plan, or EL status.

# Chapter 5

## Scoring and Reporting

This chapter describes the scoring and reporting services of PreACT<sup>®</sup> Secure<sup>™</sup>. Additional information on reporting and data services may be found in the *PreACT Secure Interpretative Guide for Student and Aggregate Reports*, available in PDF at <https://www.act.org/content/dam/act/secured/documents/PreACT-Secure-Interpretive-Guide.pdf>.

PreACT Secure scores support interpretations related to college and career readiness. The scores can be linked to descriptions of the knowledge and skills important for college and career readiness and are also linked to college readiness performance standards. The ACT College and Career Readiness Standards provide descriptions of the knowledge and skills students at different score levels typically have. The PreACT Readiness Levels indicate whether students are on target to meet the ACT College Readiness Benchmarks. In addition, PreACT Secure scores support “college-ready now” interpretations through their alignment to the ACT score scale (and ACT College Readiness Benchmarks). Together, the empirically derived Standards and Benchmarks support interpretations of college and career readiness as well as the identification of the knowledge and skills that are key to student success.

### 5.1 Reporting and Data Services

#### 5.1.1 Student Report

The student reports include the following information:

- **PreACT Secure test scores**, including scores for the four section tests (English, math, reading, and science), the Composite score, and the STEM score. The Composite score is the rounded unweighted average of the four test section scale scores, and the STEM score is the rounded unweighted average of the math and science scale scores (with fractions of 0.5 and higher rounding up).
- **Predicted ACT Composite Score Range** is the range within which the student’s ACT Composite score is expected to fall when the student takes the ACT in the spring of 11th grade. Predictions are also provided for the four test section scores and the STEM score. The predicted score ranges were derived using historical PreACT and ACT data, as described in [Chapter 6](#).
- **U.S. Ranks (National Norms)**, which are adopted from PreACT national norms, are the approximate percentages of recent testers, at the same grade level and season (fall or spring), whose PreACT and PreACT Secure scores are less than or equal to the student’s scores. For example, a rank of 56 for the student’s Composite score indicates that 56% of other tested students earned that Composite score or below.
- **Progress Toward the ACT<sup>®</sup> WorkKeys<sup>®</sup> National Career Readiness Certificate<sup>®</sup> (NCRC<sup>®</sup>)** indicator provides an estimate of students’ most likely level on the ACT NCRC given their Composite scores. The NCRC is an assessment-based credential that

documents foundational work skills important for job success across industries and occupations.

- **Detailed PreACT Secure Results** describe students' performance on the reporting categories of the four section tests.

### 5.1.2 *Summary Reports*

Summary reports provide aggregated data for different groups of students. Results are aggregated by testing year, season (fall or spring), and grade level.

- **My Summary Results** summarizes performance on each section of the test. It reports mean scores (including the Composite and STEM scores) and the percentage of students scoring at each readiness level.
- **How did our students respond to local items?** summarizes responses to each locally administered survey question, providing the number and percentage of students with each response.
- **Average Scores by Ethnicity and Gender** reports mean PreACT Secure test scores by gender and race/ethnicity.
- **Local Quartile** reports the percentage of students scoring within each national quartile (first quartile: national percentile ranks of 1–24; second quartile: national percentile ranks of 25–49; third quartile: national percentile ranks of 50–74; fourth quartile: national percentile ranks of 75–100). It also provides the range of PreACT Secure test scores for each quartile.

### 5.1.3 *Additional Online Reporting Tools*

**Data Tools** provides summary statistics, frequency distributions, cross-tabulations, and scatterplots to support additional data analysis. The **Download Hub** allows users to download the complete student-level data file for additional analysis or integration with other data systems.

## 5.2 **Progress Toward the ACT NCRC Indicator**

The Progress Toward the ACT NCRC indicator provides students with information about their level of career readiness based on their PreACT Secure Composite scores. More specifically, this indicator predicts the ACT NCRC level that students are likely to obtain if they take the ACT test in the spring of 11th grade and the WorkKeys test during the same academic year. To make this prediction possible, ACT linked the PreACT Composite score to the ACT Composite score and linked the ACT Composite score to the appropriate ACT NCRC level. The link between ACT Composite scores and ACT NCRC levels was established using the data of nearly 79,000 11th and 12th graders who took the ACT and all three ACT NCRC assessments during the 2017–2018 academic year (Radunzel & Fang, 2018). Subsequent parts of this section describe the links between PreACT Composite scores, ACT Composite scores, and ACT NCRC levels.

PreACT and 11th-grade ACT test scores collected through the spring of 2022 were used to derive the predicted ACT NCRC levels for two groups of students:

- 9th-grade PreACT sample: 81,531 students who took PreACT ( $n = 74,862$ ) or PreACT 8/9 ( $n = 6,669$ ) in 9th grade and took the ACT test in 11th grade, 24 to 30 months after taking PreACT or PreACT 8/9.
- 10th-grade PreACT sample: 879,588 students who took PreACT in 10th grade and took the ACT test in 11th grade, 12 to 18 months after taking PreACT.

Test score summary statistics and correlations for the two groups are presented later in this technical manual (see [Table 7.3](#)).

Logistic regression was used to find the PreACT Composite scores associated with a 50% chance of obtaining each ACT NCRC level or higher. Note that the 50% cut score was calculated from the logistic regression coefficients as  $-1 \times \text{Intercept} / \text{Slope}$ . Table 5.1 provides the logistic regression parameter estimates, the standard errors for those estimates, and the cut scores associated with meeting each ACT NCRC level. The final cut scores were obtained by rounding the cut score estimates to the nearest whole number.

**Table 5.1. Composite Score Ranges Corresponding to Predicted ACT NCRC Levels**

PreACT Grade Level	ACT NCRC Level	Intercept		Slope		50% Cut Score	
		Beta	SE	Beta	SE	Estimate	Rounded
9	Bronze	-5.769	0.112	0.616	0.008	9.37	9
	Silver	-10.307	0.086	0.736	0.006	14.00	14
	Gold	-12.987	0.092	0.717	0.005	18.10	18
	Platinum	-15.610	0.128	0.695	0.006	22.45	22
10	Bronze	-6.153	0.032	0.604	0.002	10.19	10
	Silver	-11.604	0.027	0.752	0.002	15.43	15
	Gold	-15.306	0.034	0.761	0.002	20.12	20
	Platinum	-18.695	0.054	0.754	0.002	24.80	25

Table 5.2 shows the Composite scale score ranges for both PreACT or PreACT Secure (Grades 9 and 10) and the ACT score ranges that correspond to different predicted ACT NCRC levels. The PreACT scale score ranges may be subject to change as more data are collected.

**Table 5.2. Composite Score Ranges Corresponding to Predicted ACT NCRC Levels**

Predicted ACT NCRC Level	PreACT or PreACT Secure Composite Score Range		ACT Composite Score Range
	Grade 9	Grade 10	
Below Bronze	1–8	1–9	1–12
Bronze	9–13	10–14	13–16
Silver	14–17	15–19	17–21
Gold	18–21	20–24	22–26
Platinum	22–35	25–35	27–36

*Note.* For more information on the Progress Toward the ACT NCRC Indicator, visit [www.act.org/NCRC-indicator](http://www.act.org/NCRC-indicator).

### 5.3 ACT College and Career Readiness Standards

The ACT College and Career Readiness Standards are statements that describe what students who score in various score ranges on the ACT section tests are *likely* to know and be able to do. ACT began developing the Standards in 1997 and continues to refine them as new data become available. The Standards are based on empirical data that include normative data, college admissions criteria, and information obtained through ACT's Course Placement Service. Content specialists wrote the Standards based on their analysis of the skills and knowledge students need to respond successfully to test items that were answered correctly by 80% or more of the examinees who scored within each score range.

A full account of the development of the Standards and a description of the Standards for each test section are given in the *ACT Technical Manual* (ACT, 2022).

### 5.4 ACT College Readiness Benchmarks

The ACT College Readiness Benchmarks are ACT scores that represent the level of achievement required for a student to have a 50% chance of obtaining a B or higher (or about a 75% chance of obtaining a C or higher) in corresponding credit-bearing first-year college courses at a typical 2-year or 4-year postsecondary institution. These college courses or course areas and the current Benchmarks are given in Table 5.3.

**Table 5.3. ACT College Readiness Benchmarks**

College Courses and Course Areas	ACT Test Score	ACT Benchmark
English Composition I	English/Writing	18
College Algebra	Math	22
American history, other history, psychology, sociology, political science, and economics	Reading	22
Biology	Science	23
Calculus I, biology, chemistry, physics, and engineering	STEM	26
English Composition I, American history, other history, psychology, sociology, political science, and economics	ELA	20

The Benchmarks are empirically derived and based on the actual performance of students in college. Through ACT's postsecondary research services and other research partnerships, ACT has assembled an extensive database consisting of course grades and test score data from a large number of first-year students and a wide range of postsecondary institutions. These data provide an overall measure of what it takes to be successful in selected first-year college courses.

The Benchmarks are subject to change over time. Some of the possible reasons for updating the Benchmarks include changes in college grading standards and changes in college student performance. The Benchmarks for English, math, reading, and science were updated in 2013

with more recent data from 214 institutions and over 230,000 students. The STEM and ELA Benchmarks were established more recently.

Students, parents, and counselors can use the Benchmarks to determine the academic areas in which students are ready for college coursework, as well as areas in which they may need more preparation. Although the Benchmarks are useful predictors of success in first-year college courses, ACT scores above the cutoffs do not guarantee success. Factors other than academic preparedness, such as motivation and good study habits, are also important to success in college (Robbins et al., 2004).

A description of the development of the ACT College Readiness Benchmarks is provided in the *ACT Technical Manual* (ACT, 2022) and various ACT research reports (Allen & Scoring, 2005; Allen, 2013; Mattern et al., 2015; Radunzel et al., 2015; Radunzel et al., 2017).

## 5.5 PreACT Readiness Levels and Benchmarks

PreACT Secure tests can be used to monitor students' progress toward college and career readiness. Based on research using scores from the PreACT assessment, PreACT Secure scores are classified into one of three readiness levels:

- On Target.** Students scoring in this range are predicted to meet or exceed the ACT College Readiness Benchmark in 11th or 12th grade. The PreACT Readiness Benchmark is the score associated with a 50% chance of meeting the ACT College Readiness Benchmark in 11th or 12th grade and is the minimum score for the On Target range.
- Close to Target.** Students scoring in this range have less than a 50% chance, but greater than a 25% chance, of meeting the ACT College Readiness Benchmark.
- In Need of Intervention.** Students scoring in this range have less than a 25% chance of meeting the ACT College Readiness Benchmark.

PreACT Readiness Levels are specific to grade level (8, 9, 10, or 11), resulting in five sets of readiness levels for each score (English, math, reading, science, and STEM). The scale score ranges for the PreACT Readiness Levels that were derived in the spring of 2020 are listed in Table 5.4.

Table 5.4. Scale Score Ranges for PreACT Readiness Levels

Test Section	Grade Level and Season	In Need of Intervention	Close to Target	On Target
<b>English</b>	Grade 8, Fall	1–7	8–10	11–35
	Grade 8, Spring	1–7	8–10	11–35
	Grade 9, Fall	1–8	9–11	12–35
	Grade 9, Spring	1–9	10–12	13–35
	Grade 10, Fall	1–10	11–13	14–35
	Grade 10, Spring	1–11	12–14	15–35
	Grade 11, Fall	1–12	13–15	16–35
<b>Math</b>	Grade 8, Fall	1–12	13–14	15–35
	Grade 8, Spring	1–13	14–15	16–35
	Grade 9, Fall	1–14	15–16	17–35

### 5.5.1 Derivation of PreACT Readiness Levels and Benchmarks

PreACT and ACT test scores collected through the spring of 2020 were used to derive the PreACT Readiness Levels and Benchmarks. PreACT records were linked to ACT records from the spring or summer of 11th grade and the fall, spring, or summer of 12th grade. Five samples were created:

- Fall Grade 9: 10,673 students who took the PreACT between September and December of 9th grade prior to taking the ACT in 11th and/or 12th grade
- Spring Grade 9: 11,425 students who took the PreACT between February and June of 9th grade prior to taking the ACT in 11th and/or 12th grade
- Fall Grade 10: 193,425 students who took the PreACT between September and December of 10th grade prior to taking the ACT in 11th and/or 12th grade
- Spring Grade 10: 158,611 students who took the PreACT between February and June of 10th grade prior to taking the ACT in 11th and/or 12th grade
- Fall Grade 11: 40,654 students who took the PreACT between September and December of 11th grade prior to taking the ACT in 11th and/or 12th grade

Each sample was weighted to approximately match a target population—the 2019 cohort of ACT-tested high school graduates. After weighting, each sample approximately matched the target population. For example, Table 5.5 provides the distribution of background variables for the Fall Grade 10 sample before and after weighting.

Table 5.5. Characteristics of the Fall Grade 10 Sample

Characteristic	Sample %		Population %	
	Raw	Weighted		
<b>Gender</b>	Other/Missing	0.6	1.6	1.6
	Female	53.7	52.0	52.0
	Male	45.7	46.4	46.4
<b>Race/Ethnicity</b>	African American/Black	8.8	12.2	12.5
	White	57.5	51.7	51.6
	Hispanic	12.2	16.4	16.4

	Grade 9, Spring	11,425	18.4	6.0	22.3	6.9	51.1%
	Grade 10, Fall	193,425	19.6	6.3	22.1	6.8	49.9%
	Grade 10, Spring	158,611	20.3	6.5	22.2	7.0	50.3%
	Grade 11, Fall	40,654	21.3	6.7	22.1	6.9	50.5%
Science	Grade 9, Fall	10,673	17.5	4.9	21.6	5.7	42.6%
	Grade 9, Spring	11,425	18.2	5.2	21.6	5.8	42.7%
	Grade 10, Fall	193,425	18.8	5.2	21.4	5.7	40.7%
	Grade 10, Spring	158,611	19.3	5.4	21.5	5.9	42.3%
	Grade 11, Fall	40,654	19.8	5.5	21.6	5.7	42.8%
STEM	Grade 9, Fall	10,673	17.6	4.0	21.5	5.4	23.8%
	Grade 9, Spring	11,425	18.3	4.3	21.5	5.4	23.4%
	Grade 10, Fall	193,425	18.9	4.5	21.2	5.3	21.9%
	Grade 10, Spring	158,611	19.4	4.8	21.2	5.5	22.6%
	Grade 11, Fall	40,654	20.1	5.0	21.4	5.3	22.8%

For each sample and each PreACT section, logistic regression was used to model the probability of meeting the ACT College Readiness Benchmark as a function of PreACT test score. The PreACT Readiness Benchmark (cut score for the On Target readiness level) was chosen as the score that most accurately reflected a .50 probability of meeting the ACT College Readiness Benchmark. Similarly, the cut score for the Close to Target readiness level was chosen as the score that most accurately reflected a .25 probability of meeting the ACT College Readiness Benchmark. In a few cases (Fall Grade 9 math and Spring Grade 10 math), the cut score for Close to Target was lowered by one point to ensure that the Close to Target cut score was at least two points lower than the On Target cut score. Table 5.4 shows the resulting PreACT Readiness Levels.

The PreACT Readiness Levels will be used to help stakeholders interpret PreACT Secure scores. Future research will examine whether different readiness levels are needed for PreACT and PreACT Secure.

### **5.5.2 College and Career Readiness Rates by PreACT Readiness Level**

After taking PreACT Secure, students still have time to grow academically before taking the ACT test in 11th or 12th grade. Students who score below the On Target level may still meet the ACT College Readiness Benchmark later in high school.

By design, most students who meet the PreACT Readiness Benchmark (and hence score in the On Target range) should go on to meet the ACT College Readiness Benchmark. Similarly, around 25% of students who score in the Close to Target range should meet the ACT College Readiness Benchmark, and fewer than 25% who score in the In Need of Intervention range should meet the ACT College Readiness Benchmark.

Informed by the same data sets used to derive the PreACT Readiness Levels, Table 5.7 shows the percentage of students who met the ACT College Readiness Benchmark by test section, grade level and season, and PreACT Readiness Level. Among students who scored in the On Target range, the percentage meeting the ACT College Readiness Benchmark ranged from 73% to 87%; among those in the Close to Target range, the percentage ranged from 22% to 38%; and among those in the In Need of Intervention range, the percentage ranged from 3% to 16%. The percentages show that the PreACT Readiness Levels are accurate predictors of college and career readiness, and that many students who are not on target when they take PreACT are able to grow enough academically to meet the ACT College Readiness Benchmarks.

Table 5.7. Percentage Meeting ACT College Readiness Benchmark, by PreACT Readiness Level

Test Section	Grade Level and Season	PreACT Readiness Level		
		In Need of Intervention	Close to Target	On Target
<b>English</b>	Grade 9, Fall	16.3%	32.5%	84.0%
	Grade 9, Spring	11.5%	30.7%	84.5%
	Grade 10, Fall	11.9%	30.4%	82.2%
	Grade 10, Spring	11.5%	31.5%	85.4%
	Grade 11, Fall	11.2%	35.1%	87.1%

	Grade 10, Spring	3.5%	36.7%	82.0%
	Grade 11, Fall	2.7%	25.8%	75.1%

# Chapter 6

## Scaling, Equating, and Technical Characteristics

Scale scores are reported for PreACT® Secure™ English, math, reading, and science tests. Scale scores are also reported for the Composite score and the STEM score. The range of all PreACT Secure scale scores is 1 to 35. More background information on the PreACT Secure scale is available in [Section 2.6](#). This chapter discusses equating methods and characteristics of PreACT Secure tests. Section 6.1 describes the equating procedure of PreACT Secure. Section 6.2 documents how the predicted ACT® score ranges are derived. Section 6.3 describes the PreACT Secure score ranges. Section 6.4 presents the summary of the operational test data from students taking PreACT Secure tests in Spring 2023. Section 6.5 describes the PreACT Secure norms. Sections 6.6 to 6.8 present the results of psychometric analyses, including differential item functioning, reliability, measurement error, and classification consistency based on the Spring 2023 operational data.

### 6.1 Equating of PreACT Secure Tests

Post-equating was conducted to create raw-to-scale score conversion tables for each test section of the PreACT Secure tests administered in Spring 2023. It was performed through the following procedure. First, based on the responses of Grade 10 students in the equating sample, operational items on the two main forms were calibrated separately with the Item Response Theory (IRT) Three-Parameter Logistic model. Next, the calibrated item parameters were aligned to the ACT item pool scale with the Stocking-Lord linking procedure. Finally, the IRT true score equating was conducted to establish conversion tables. These derived conversion tables are used to transform raw scores on the new forms to scale scores.

The Composite and STEM scores, which constitute combinations of individual test section scores, are not directly equated. Instead, they are derived from the rounded arithmetic mean of scale scores originating from two or four test sections.

### 6.2 Predicted ACT Score Ranges

One of the intended uses of PreACT Secure is to predict performance on the ACT test. PreACT Secure score reports provide predicted ACT score ranges, and separate predictions are reported for Grades 9 and 10 with the assumption that students will take the ACT test in 11th grade. PreACT and 11th-grade ACT test scores collected through Spring 2022 were used to derive the predictions using two groups of students:

- 9th-grade PreACT sample: 81,531 students who took the PreACT (n=74,862) or PreACT 8/9 (n=6,669) test in 9th grade and took the ACT test in 11th grade, 24 to 30 months after taking the PreACT or PreACT 8/9 test.
- 10th-grade PreACT sample: 879,588 students who took the PreACT test in 10th grade and took the ACT test in 11th grade, 12 to 18 months after taking the PreACT test.

These samples were used to estimate the predicted ACT score ranges that are used for PreACT Secure reporting for Spring 2023. Test score summary statistics and correlations for the two groups are presented in [Table 7.3](#).

For each section test score, Composite score, and STEM score, the predicted ACT score ranges are based on a regression model where PreACT test score (for Grade 9 or 10) is used to predict Grade 11 ACT test score. The regression model uses linear and quadratic effects of the PreACT score to predict the ACT score, and a 50% prediction interval forms the endpoints of the predicted score range.

Research has shown that ACT test scores declined during the COVID-19 pandemic (Allen, 2022; see the [ACT Research website](#) for the full report). For purposes of deriving the predictions, we classified student records as having been disrupted by the onset of the COVID-19 pandemic if the PreACT test occurred before March 1, 2020, and the ACT test occurred after June 1, 2020. (Across the United States, most in-person schooling was suspended during this period.) For the 9th-grade PreACT sample, 38,588 records were disrupted by the pandemic and 42,943 records were not disrupted by the pandemic. For the 10th-grade PreACT sample, 143,930 records were disrupted by the pandemic and 735,658 records were not disrupted by the pandemic.

We included an indicator variable for pandemic disruption in the regression models for predicting ACT scores. By doing so, disruption-adjusted and regular score predictions (which assume that students' ACT scores are not subject to the disruption) can be obtained. The disruption-adjusted predictions are generally lower than the regular score predictions. Because the predictions will be applied to students who will take the PreACT Secure and ACT tests after the pandemic onset, we will use the regular score predictions for reporting predicted ACT score ranges.

Using the same data that was used to derive the predictions, we examine the accuracy of the predicted ACT score ranges. For records not disrupted by the pandemic, Table 6.1 provides the percentage of students scoring below, within, and above their predicted ACT score range. By design, the percentage of students scoring below their prediction is about the same as the percentage of students scoring above their prediction. Note that the 50% prediction interval results in a coverage rate of about 60% because the test scores are integers and scores that equal the interval endpoints are considered in the interval.

Table 6.2 provides the prediction accuracy rates for records that were disrupted by the pandemic. While the prediction intervals still included at least 50% of the actual test scores, we see that students' ACT scores tended to fall below their predicted range. This is evidence that students whose education was disrupted by the onset of the pandemic experienced less academic growth.

**Table 6.1. Percent Scoring Below, Within, and Above Predicted ACT Score Ranges Among Records Not Disrupted by the Onset of the COVID-19 Pandemic**

PreACT Grade	Test Section	Actual ACT Score Relative to Predicted Score Range		
		% Below	% Within	% Above
9	English	23.1	55.7	21.2
	Math	19.9	59.9	20.2

### 6.3 PreACT Secure Score Ranges

Measurement precision on the PreACT Secure student score reports is represented by  $\pm 1$  CSEM (conditional standard error of measurement) from the student's scale score. CSEM values were computed for each form following the IRT-based procedure described by Kolen and Brennan (2004, pp.301–302) with simulated  $\theta$  values from  $-8$  to  $8$ . The specific steps and formula for computing the CSEM values are as follows:

Step 1. For a given specific  $\theta_i$  point, the recursive formula by Lord and Wingersky (1984) was used to find the conditional distribution of observed raw scores, which is symbolized as  $f(X|\theta_i)$ . Based on the raw-to-scale conversion table obtained using the IRT true score equating method,  $f(X|\theta_i)$  was transformed to the conditional distribution of possible scale score points for a certain examinee with a specific ability of  $\theta_i$ .

Step 2. The expected mean of the conditional distribution of scale scores given  $\theta_i$  is

$$\xi(\theta_i) = \sum_{j=0}^K sc(j)f(X = j | \theta_i)$$

where  $sc(j)$  represents the corresponding scale score for a raw score point  $j$  based on the raw-to-scale score conversion on a test with  $K$  items.

Step 3. Conditional measurement error variance of scale scores given  $\theta_i$  is

$$var[sc(j)|\theta_i] = \sum_{j=0}^K [sc(j) - \xi(\theta_i)]^2 f(X = j | \theta_i)$$

The square root of the above error variance represents the CSEM of scale scores at a given  $\theta_i$ . For each scale score from 1 to 35, the corresponding raw score and  $\theta$  were located. The CSEM values were calculated through the formula above and were rounded to integers. Considering the values across forms were very close, it was decided, for simplicity, to use the final scale score CSEM values obtained based on the forms administered in Spring 2023. The scale score CSEM values are continuously monitored and will be updated if significant deviations are found. CSEM values for all PreACT Secure scale scores can be found in Table 6.3.

Table 6.3. PreACT Secure CSEM Values

## 6.4 PreACT Secure Spring 2023 Operational Test Data

Over 130,000 examinees took the PreACT Secure tests in Spring 2023. Tables 6.4 and 6.5 show the distributions of data for students in Grades 9 and 10, respectively, based on gender and ethnicity. Considering the relatively small sample size and concerns over privacy, data for other grades is not included in the report.

**Table 6.4. PreACT Secure Spring 2023 Operational Test Data Distribution by Gender and Grade in Wisconsin**

Gender	Grade 9	Grade 10
Female	28,025	28,650
Male	29,559	30,371
Other*	2,142	2,061

Note. \* Other category includes 'Another gender,' 'Prefer not to respond,' and missing.

**Table 6.5. PreACT Secure Spring 2023 Operational Test Data Distribution by Ethnicity and Grade in Wisconsin**

Race/Ethnicity	Grade 9	Grade 10
African American/Black	3,515	4,194
American Indian/Alaskan Native	421	493
White	37,446	37,148
Hispanic/Latino	597	647
Asian	2,158	2,107
Native Hawaiian/Other Pacific Islander	49	54
Two or more races	6,579	6,649
Prefer not to respond	4,878	5,503
Missing	4,083	4,287

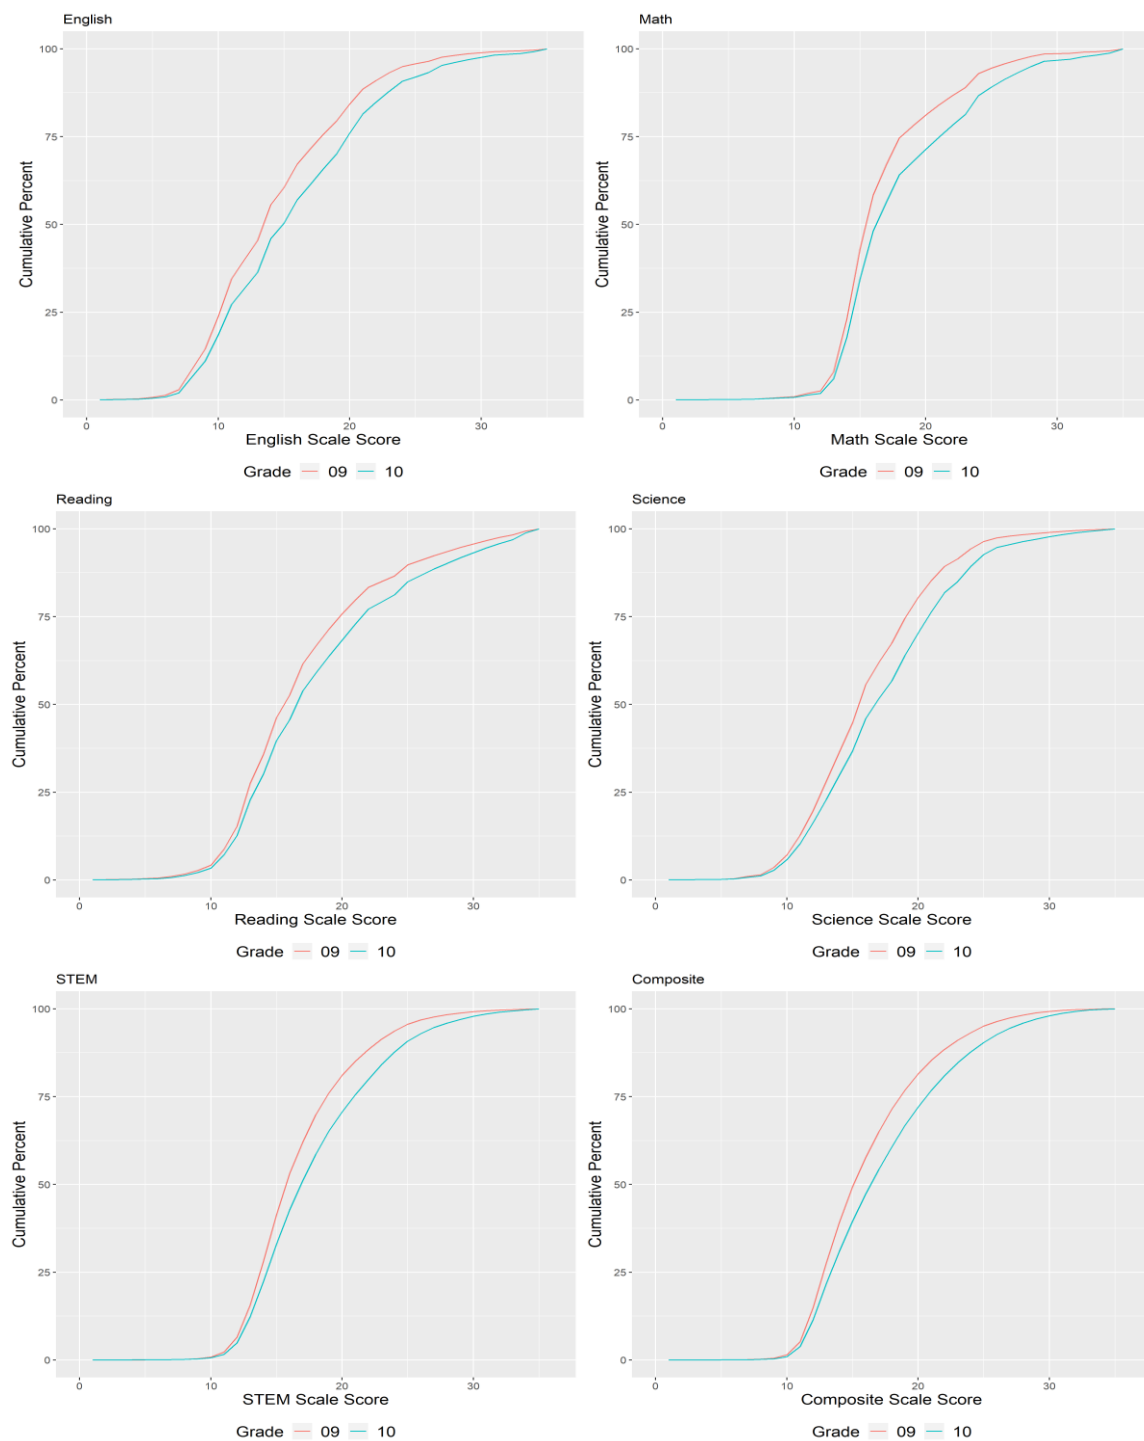

### **Scale Score Statistics for the PreACT Secure Spring 2023 Test Sample**

Table 6.6 shows the scale score summary statistics for students in Grades 9 and 10 in the PreACT Secure Spring 2023 sample. Figure 6.1 shows how the scale scores are distributed for the two grades.

**Table 6.6. Scale Score Summary Statistics for Wisconsin 9th and 10th Graders**

Grade	Test Section	Mean	SD	Skewness	Kurtosis

**Figure 6.1. Scale Score Distributions of Wisconsin Students by Grade**

### **Effective Weights**

As with the ACT, the PreACT Secure Composite score is the rounded average of the scale scores of the English, math, reading, and science test sections. This score evaluates students' general educational development over the four areas. Therefore, it is necessary to report the

contributions of individual test section scores to a combined score, which is represented by effective weight. According to Wang and Stanley (1970), effective weight is defined as the statistical contribution of the test to the variance of the Composite. The effective weights are calculated based on the variance-covariance matrix between the scale scores. Since the scale scores from the four test sections were equally weighted to compute the Composite score, effective weights,  $ew_i$ , were calculated as

$$ew_i = \frac{\sigma_i^2 + \sum_{j \neq i} \sigma_{ij}}{\sum_i [\sigma_i^2 + \sum_{j \neq i} \sigma_{ij}]}$$

where  $\sigma_i^2$  is the variance of scale scores on test section  $i$ , and  $\sigma_{ij}$  is the covariance between scale scores on test sections  $i$  and  $j$ .

Table 6.7 contains the variance-covariance matrix of the scale scores of one operational form for effective weights calculation based on Spring 2023 operational data. For example, the effective weight for English was computed by adding the four numbers in the first row (33.76, 18.53, 27.49, and 20.52). This sum was then divided by the sum of all the elements in the variance-covariance matrix. Since both variance and covariance are included in the numerator, a greater variance or covariance with other test sections could lead to a greater effective weight.

Tables 6.8 and 6.9 contain the effective weight for each test section score contributing to the variances of the Composite and STEM scores separately based on the two operational forms. Regarding these scores, the effective weights remain consistent across both forms. The effective weights for typical ACT forms from the most recent *ACT Technical Manual* (ACT, 2022) are provided as references. From Table 6.9, it should be noted that, compared with the science score, the math score has a slightly larger effective weight in STEM for the ACT test. By contrast, for PreACT Secure, the science score has a slightly larger effective weight in STEM. One possible explanation could be that, compared with the ACT, the science score on the PreACT Secure test has larger variance values than the math score, as shown in Table 6.7. Note that the summation of some proportions in Table 6.9 does not equal one due to rounding errors.

**Table 6.7. Scale Score Variance-Covariance Matrix for the PreACT Secure Tests based on Wisconsin Students**

Test	Test Section	English	Math	Reading	Science
PreACT Secure	English	33.86	18.76	27.7	20.7
	Math	18.76	22.28	18.65	16.91
	Reading	27.7	18.65	37.6	22.37
	Science	20.7	16.91	22.37	25.64

Table 6.8. Effective Weights of Composite Score for the PreACT Secure and ACT Tests

Test	Test Section	Number of Items	Proportion of Total	Effective Weight
PreACT Secure	English	36	0.29	0.27–0.28
	Math	33	0.27	0.20–0.21
	Reading	25	0.20	0.28–0.29
	Science	30	0.24	0.22–0.24
ACT	English	75	0.35	0.27–0.29

Table 6.9. Effective Weights of STEM Score for the PreACT Secure and ACT Tests

Test	Test Section	Number of Items	Proportion of Total	Effective Weight
PreACT Secure	Math	33	0.52	0.46–0.49
	Science	30	0.48	0.51–0.54
ACT	Math	60	0.60	0.50–0.52
	Science	40	0.40	0.48–0.50

\*Note: The PreACT Secure results are based on Wisconsin students.

## Correlations

The correlations of scale scores were computed based on the Spring 2023 PreACT Secure data and compared with the scale score correlations from the most recent *ACT Technical Manual* (ACT, 2022), as shown in Table 6.10. Correlations among PreACT Secure scale scores are slightly lower than those of the ACT.

Table 6.10. Correlations Among the PreACT Secure Scores and ACT Test Scores

Test	Test Section	English	Math	Reading	Science	Composite	STEM
PreACT Secure	English	1	0.68	0.78	0.7	0.9	0.75
	Math	—	1	0.64	0.71	0.84	0.92
	Reading	—	—	1	0.72	0.9	0.74
	Science	—	—	—	1	0.88	0.93
	Composite	—	—	—	—	1	0.93
	STEM	—	—	—	—	—	1
ACT	English	1.00	0.77	0.80	0.78	0.93	0.81
	Math	—	1.00	0.69	0.81	0.89	0.95
	Reading	—	—	1.00	0.77	0.90	0.77
	Science	—	—	—	1.00	0.91	0.95
	Composite	—	—	—	—	1.00	0.95
	STEM	—	—	—	—	—	1.00

\*Note: The PreACT Secure results are based on Wisconsin students.

## 6.5 PreACT Secure Norms

One of the intended uses of PreACT Secure test scores is to understand student performance relative to national norms. PreACT Secure score reports provide percentile ranks for English, math, reading, science, STEM, and Composite scores. A PreACT norming study is typically conducted each year, and the results are used to assign percentile ranks to scores. The goal of the norming study is to estimate norms (including percentile ranks) that are representative of examinees across the country who take the ACT test. Norms are estimated for Fall Grade 9, Spring Grade 9, Fall Grade 10, Spring Grade 10, and Fall Grade 11, respectively. Sample selection and weighting procedures are used to ensure that each sample is representative of the ACT-tested population with respect to gender, race/ethnicity, geographic region, and school category (defined by public/nonpublic status and percentage of students eligible for free and reduced price lunch). Through this design, student performance on the PreACT can be understood for each grade level and season, relative to the population of students who go on to take the ACT test. Detailed descriptions of the PreACT norming studies, including norming samples, weighting methodology, estimation procedures, and analyses results, is documented in separate reports (Lu & Allen, 2019). The most recent norm tables can be found at <https://success.act.org/s/article/PreACT-and-PreACT-89-US-Ranks>.

The percentile ranks reported for PreACT Secure are based on the most recent PreACT norming study. However, future studies will examine whether different norms are needed for PreACT and PreACT Secure.

## 6.6 Differential Item Functioning

Differential item functioning (DIF) can be described as a statistical difference between the probability of the specific population subgroup (the “focal” group) getting the item right and the comparison population subgroup (the “reference” group) getting the item right given that both groups have the same level of expertise with respect to the content being tested. DIF analyses of the PreACT Secure tests were conducted separately for Grades 9 and 10 and each operational form. The procedures currently used for the PreACT Secure DIF analyses include the standardized difference in proportion correct (STD) procedure and the Mantel-Haenszel common odds-ratio (MH) procedure (Holland & Thayer, 1988). Detailed descriptions of these statistics and their performance in detecting DIF is documented in the ACT Research Report entitled *Performance of Three Conditional DIF Statistics in Detecting Differential Item Functioning on Simulated Tests* (Spray, 1989).

Both the STD and MH techniques are designed for use with multiple-choice items, and both require data from a significant number of students to provide reliable results. Testing industry standards require a minimum of 300 students for the focal group and 700 students overall (Zwick, 2012). As a result, DIF analyses of PreACT Secure tests were conducted on each multiple-choice item for the seven group comparisons, as shown in Table 6.11 below.

**Table 6.11. Group Comparison for DIF Analyses**

Focal Group	Reference Group
Female	Male
African American/Black	White
Hispanic	White
Asian	White
American Indian or Alaska Native	White
Pacific Islander	White
Two or More Races	White

Using pre-established criteria, any items in the two operational forms administered during Spring 2023 with STD or MH values exceeding the tolerance level were flagged. The flagging criteria for the STD procedure is to flag items when the absolute value of STD is greater than 0.10. Based on the STD procedure, for English, DIF was observed across various comparison groups: one item for female/male comparison, two items for Black/White comparison, five items for Hispanic/White comparison, and three items for Asian/White comparison; no item manifested DIF for math; and one item each from the reading and science sections demonstrated DIF in the Asian/White comparison. Table 6.12 shows the criteria for flagging DIF in multiple-choice items related to the MH procedure. In this table, MH-CHISQ denotes the p-value of the MH chi-square statistic and MH-D signifies the delta-scaled MH alpha. Table 6.13 presents the items flagged according to the MH procedure. The comparison groups with no DIF B or DIF C across all test sections are not included in the table. Following the STD procedure, English has a relatively higher count of item flagged with DIF, while reading and science have fewer. The content experts reviewed all the flagged items and found no evidence of bias towards any specific group.

**Table 6.12. Criteria for the A, B, and C DIF Categories on MH Procedure**

Category	Description	Criterion
A	Negligible DIF	Nonsignificant MH-CHISQ ( $P > 0.05$ ) or $ MH-D  < 1.0$
B	Moderate DIF	Significant MH-CHISQ ( $P \leq 0.05$ ) and $1.0 \leq  MH-D  < 1.5$
C	Large DIF	Significant MH-CHISQ ( $P \leq 0.05$ ) and $ MH-D  \geq 1.5$

Table 6.13. Summary of DIF Analysis on Wisconsin student data using the MH Procedure

Test Section	DIF Group	A	B	C	Total Number of Items
English	Asian/White	66	5	1	72
	Black/White	67	5	0	72
	Female/Male	70	2	0	72
	Hispanic/White	68	4	0	72
Math	Asian/White	63	3	0	66
	Black/White	65	1	0	66
	Female/Male	63	2	1	66
	Hispanic/White	65	1	0	66
Reading	Asian/White	49	1	0	50
	Black/White	50	0	0	50
	Female/Male	50	0	0	50
	Hispanic/White	50	0	0	50
Science	Asian/White	59	1	0	60
	Black/White	59	1	0	60
	Female/Male	60	0	0	60
	Hispanic/White	60	0	0	60

## 6.7 Reliability and Measurement Error

Reliability quantifies the level of consistency in test scores across repeated test administrations and is usually estimated based on a single test administration. Coefficient alpha is one of the most widely used measures of reliability, and it provides reliability estimates for number correct scores. Table 6.14 shows the coefficient alpha reliability estimates for the raw scores of the two PreACT Secure operational forms administered in Spring 2023.

Table 6.14. Coefficient Alpha Reliability Estimates for Raw Scores using Wisconsin student data

Form	English	Math	Reading	Science
A	0.85	0.87	0.84	0.84
B	0.87	0.89	0.85	0.81

Under the framework of item response theory, scale score reliability estimates were calculated using the formula by Kolen, Zeng, and Hanson (1996). The specific formula for scale score reliability is

$$SEM_t^2 = \int_{\theta} var[sc(j)|\theta]g(\theta)d\theta$$

$$REL_t = 1 - \frac{SEM_t^2}{s_t^2}$$

where  $SEM_t^2$  is the estimated error variance of the measurement for test section  $t$ , and  $s_t^2$  is the sample variance of the observed scale score for the section. In addition,  $var[sc(j)|\theta]$  is the conditional measurement error variance of scale scores for a given  $\theta$ , and  $g(\theta)$  is the posterior distribution of  $\theta$  obtained from the empirical data.

The  $SEM$  values for each test section (English, math, reading, and science) were then used to calculate the reliabilities of the STEM and Composite scale scores. The estimated standard error of measurement for the Composite score ( $SEM_c$ ) is calculated as

$$SEM_c = \frac{\sqrt{\sum_{t=1}^4 SEM_t^2}}{4}$$

where the summation is over  $SEM^2$  of the four test sections. The estimated reliability of the Composite score ( $REL_c$ ) is calculated as

$$REL_c = 1 - \frac{SEM_c^2}{s_c^2}$$

where  $s_c^2$  is the observed scale score variance for the Composite score.

Similarly, the estimated standard error of measurement for the STEM score ( $SEM_{stem}$ ) is calculated based on the summation over the  $SEM^2$  values from the math and science scale scores:

$$SEM_{stem} = \frac{\sqrt{SEM_{math}^2 + SEM_{science}^2}}{2}$$

The estimated reliability of the STEM score ( $REL_{stem}$ ) is calculated as

$$REL_{stem} = 1 - \frac{SEM_{stem}^2}{s_{stem}^2}$$

where  $s_{stem}^2$  is the observed scale score variance for the STEM.

Table 6.15 exhibits the ranges of scale score reliability estimates and the standard error of measurement (SEM) for the two operational forms based on Spring 2023 operational data. The estimated reliability and SEM ranges for the recent ACT forms (ACT, 2022) are provided as well for the purpose of comparison.

Table 6.15. Estimated Scale Score Reliabilities and Standard Error of Measurement

Test	Form	Statistic	English	Math	Reading	Science	Composite	STEM
PreACT Secure	A	Reliability	0.84	0.87	0.82	0.8	0.95	0.91
		SEM	2.23	1.56	2.33	2.06	1.03	1.29
	B	Reliability	0.86	0.88	0.82	0.76	0.95	0.91
		SEM	2.19	1.61	2.45	2.24	1.07	1.38
ACT	—	Reliability	0.93–0.94	0.92–0.93	0.84–0.89	0.85–0.89	0.96–0.97	0.94–0.95
		SEM	1.62–1.76	1.50–1.66	2.20–2.64	1.79–2.09	0.90–1.02	1.17–1.31

\*Note: The PreACT Secure results are based on Wisconsin students.

## 6.8 Classification Consistency

PreACT Secure examinees are classified into three college readiness levels based on their scale scores and PreACT Readiness Levels.<sup>1</sup> The classification consistency reflects the percentages of examinees who would be consistently classified into the same achievement levels on two equivalent administrations of the test. However, since the test (or parallel forms of the test) is not often administered twice to the same sample, it is necessary to estimate classification consistency with a single test administration using psychometric methods. Two classification consistency indices, agreement rate (Livingston & Lewis, 1995) and Kappa index (Cohen, 1960; Swaminathan et al., 1974), are used to quantify the reliability of categorizing examinees into different readiness levels.

Table 6.16 presents a summary of classification consistency indices—the agreement rate (percentage consistently classified) and Kappa index. Two Levels refers to On Target/Not on Target decisions, and Three Levels refers to classification using all three Readiness Levels (i.e., In Need, Close to Target, and On Target). As can be observed from this table, agreement rates were high with two levels and moderate with three levels for all scores.

Table 6.16. Classification Consistency

Form	Test Section	Two Levels		Three Levels	
		Agreement	Kappa	Agreement	Kappa
A	English	0.83	0.65	0.65	0.46
	Math	0.90	0.75	0.74	0.55
	Reading	0.88	0.71	0.68	0.48
	Science	0.86	0.67	0.77	0.57
	STEM	0.96	0.81	0.91	0.71
B	English	0.84	0.67	0.70	0.51
	Math	0.88	0.73	0.71	0.53
	Reading	0.89	0.76	0.73	0.54
	Science	0.84	0.62	0.70	0.48
	STEM	0.95	0.80	0.90	0.71

<sup>1</sup> Refer to [Chapter 5](#) for the details of the PreACT Readiness Levels.

# Chapter 7

## Validity Evidence

According to the *Standards for Educational and Psychological Testing*, “validity refers to the degree to which evidence and theory support the interpretations of test scores for proposed uses of tests” (American Educational Research Association [AERA] et al., 2014, p.11).

Validation is the process of justifying intended interpretations and uses and may involve logical, empirical, or theoretical components.

In this chapter, evidence of the validity of PreACT® Secure™ scores is described. Validity evidence is provided with respect to five areas: 1) test content, 2) response process, 3) internal structure, 4) relations to other variables, and 5) consequences of testing.

As discussed in [Chapter 1](#), the primary uses of PreACT Secure include

- monitoring progress toward college and career readiness,
- predicting performance on the ACT and ACT WorkKeys tests, and
- identifying academic gaps and areas for improvement.

Secondary uses of PreACT Secure include

- gauging readiness for advanced high school and college courses,
- evaluating school and program effectiveness,
- understanding performance relative to national norms, and
- satisfying accountability testing and reporting requirements.

The collection of evidence presented in this technical manual (and other PreACT Secure test documentation) supports the intended uses of PreACT Secure. Test users may develop particular interpretations and additional uses that are not covered in this chapter or this technical manual. Each use needs to be justified by a validity argument, and evidence will continue to be gathered and evaluated as the uses of PreACT Secure evolve.

### 7.1 Evidence Based on Test Content

PreACT Secure helps students prepare for the ACT and lets students and educators monitor progress toward college and career readiness. One of the intended uses of PreACT Secure is to predict student performance on the ACT, which helps facilitate educational and career planning. Based on this intended use, content-related evidence is provided through the evaluation of the connections between PreACT Secure and the ACT with respect to the content domain, the knowledge and skills implied by the PreACT Secure specifications, the characteristics of the items, and the development of test forms.

As described in [Chapters 2](#) and [3](#), PreACT Secure contains four content domains (English, math, reading, and science). PreACT Secure is designed with developmentally articulated test

specifications, ensuring that the content measured follows a logical developmental sequence across the high school experience from grades 8 and 9 (PreACT 8/9), grades 9 and 10 (PreACT or PreACT Secure), and the ACT test (grades 11 and 12). The programs also share item formats and follow consistent reporting procedures. PreACT Secure is reviewed every year by subject matter experts to ensure that its basic structure matches that of the ACT test and that the two tests' scale scores are comparable.

In addition, ACT periodically conducts academic research and surveys, including the ACT National Curriculum Survey<sup>®</sup>, to ensure the continued appropriateness of the content on PreACT Secure and the ACT. The ACT College and Career Readiness Standards are statements of what students should know and be able to do in order to be college and career ready (or on the way to becoming so) in English, math, reading, and science at each grade level. The knowledge and skills a student currently has (and areas for improvement) can be identified by examining the student's PreACT Secure or ACT test scores with respect to the Standards. These standards are consistent with many states' standards focusing on college and career readiness.

In light of the curriculum survey results, ACT subject matter experts determined the PreACT Secure test content specifications (the number and types of items to be included in each test section and the depth of knowledge [DOK] level of each item). The specific characteristics of the test items in each specification category were reviewed to determine the accuracy and appropriateness of the collection of items. Subject matter experts review new test forms to verify their content accuracy and confirm the match between the content of the tests and the content specifications. The items that fulfill the content specifications are also reviewed for content accuracy, word count, item classification, item format, and language.

Items selected to be administered on PreACT Secure have a wide distribution of item difficulties so that the tests will effectively differentiate among students who vary widely in their levels of achievement. However, since PreACT Secure is designed to be administered before the ACT, its statistical specifications are carefully reviewed to ensure that it has an overall mean item difficulty that is somewhat easier than that of a typical ACT form.

## 7.2 Evidence Based on Response Process

According to the *Standards*, some intended interpretations of test scores are based on the assumption that a particular psychological process or cognitive operation is used by test takers. "Theoretical and empirical analyses of the response processes of test takers can provide evidence concerning the fit between the construct and the detailed nature of the performance or response actually engaged in by test takers" (AERA et al., 2014, p. 15). Procedures like think-alouds and cognitive labs are commonly used to provide this type of validity evidence.

As mentioned previously, PreACT Secure, like the ACT, was developed using a theory of action. The theory of action helps answer questions related to the purpose of the assessment—intended users, uses, benefits, interpretations, and assessment outcomes. The answers to these questions provide information needed to identify high-value skill targets in each subject

area, providing focal points for the development of tasks and test forms. The process set forth by the theory of action further gives rise to potential ways of bringing about the intended goals of the assessment. For example, cognitive labs, piloting, and field testing are used to evaluate student response processes on items and iteratively improve the specifications and design of the assessment. The related analyses can provide evidence related to the fit between the constructs and the cognitive process engaged in by test takers. The collection and evaluation of all validity evidence is ongoing, and additional evidence based on response processes may be provided in the future.

### 7.3 Evidence Based on Internal Structure

As indicated by the *Standards* (AERA et al., 2014), analyzing internal structure includes evaluating intended score interpretations from the perspective of expected relationships among test items or parts of the test. Therefore, the internal structure of PreACT Secure can be evaluated via an analysis of dimensionality.

Exploratory factor analyses were conducted on data from two PreACT Secure operational forms administered in Spring 2023 to explore the dimensionality of the constructs measured by PreACT Secure. PreACT Secure measures student development in the general areas of English, math, reading, and science. While category scores were also reported to describe performance on skill areas within each subject, we expect to find one dominant dimension in an empirical analysis of dimensionality. In the exploratory factor analyses, scree plots of eigenvalues, model fit, and factor loadings were examined to provide validity evidence of internal structure.

A scree plot shows the relationship between eigenvalues and the number of extracted factors and is typically evaluated by identifying the “elbow” in the plot, which indicates the number of dimensions to retain (Cattell, 1966). Figure 7.1 shows the scree plots of one operational form for the English, math, reading, and science tests. The scree plots for the alternate operational form closely mirror these, so, for brevity and clarity, only one set of plots is presented. As shown in this figure, the elbow appears after the first eigenvalue, which is evidence for a single dimension. Table 7.1 shows the proportion of variance accounted for by the first 10 factors for the English, math, reading, and science tests for the two operational forms. Since the proportions of variance accounted for by the factors after the tenth are trivial, the table presents overall proportions for the remaining factors. As shown in this table, for each test section, the percentage of variance accounted for by the second factor was smaller than 10%. According to Hatcher (1994), factors that account for less than 10% of the variance should not be retained. As a result of that, it is reasonable to believe that PreACT Secure should be represented by a unidimensional model.

Model fit was evaluated by comparing the model fit index between one- and two-factor models, as shown by the fit statistics given in Table 7.2. The fit statistics include the widely used chi-square test, plus other fit statistics—the comparative fit index (CFI), the Tucker-Lewis index (TLI), the root mean square error of approximation (RMSEA), and the standardized root mean square residual (SRMR)—to supplement the chi-square index due to its sensitivity to large

sample sizes (Hu & Bentler, 2009; Bollen, 1989). Fit indices were flagged with an asterisk in Table 7.2 if they showed inadequate fit. Table 7.2 also shows the differences in the fit statistics (DIFF) between the one- and two-factor models. The interfactor correlation (CORR) between Factors 1 and 2 in Table 7.2 was used to evaluate how well the two factors could be distinguished from each other in the model. All these statistical indices were simultaneously evaluated to compare the goodness of fit of the one- and two-factor models. Fit statistics for the English, math, reading, and science tests showed evidence supporting the one-factor model in most cases. Although the chi-square tests were statistically significant for all tests, this was likely due to the sensitivity of chi-square statistics to large sample sizes. Compared with the use of the one-factor model, the use of the two-factor model did not substantially improve the model fit. The interfactor correlations in the two-factor model were relatively large ( $>0.5$ ) for all tests, which indicates a strong relationship between the two factors. Based on the principle of parsimony, the one-factor model was considered to be adequate for PreACT Secure.

## 7.4 Evidence Based on Relationships to Other Variables

Intended uses of PreACT Secure include monitoring progress toward college and career readiness and predicting performance on the ACT. PreACT Secure measures academic achievement related to major curriculum areas. These intended interpretations and uses of PreACT Secure test scores imply that they should be both predictive of ACT test scores and related to academic performance in high school. Studies were conducted to evaluate the relationships between PreACT test scores and ACT test scores, high school coursework and grades, success in advanced high school courses, and success on Advanced Placement (AP) exams. The results are summarized below.

### 7.4.1 Relationship With ACT Test Scores

Using PreACT and 11th-grade ACT scores collected through the spring of 2022, correlations of PreACT and ACT scores were examined. This analysis was based on two groups of students:

- 9th-grade PreACT sample: 81,531 students who took PreACT ( $n = 74,862$ ) or PreACT 8/9 ( $n = 6,669$ ) in 9th grade and took the ACT in 11th grade, 24 to 30 months after taking PreACT or PreACT 8/9
- 10th-grade PreACT sample: 879,588 students who took PreACT in 10th grade and took the ACT in 11th grade, 12 to 18 months after taking PreACT

Table 7.3 presents summary statistics and correlations of PreACT and ACT scores. In addition to Pearson correlations ( $r$ ), disattenuated correlations ( $r_{dis}$ ) are also presented. Disattenuated correlations are estimates of what the correlations would be if the PreACT and ACT tests measured achievement without error (e.g., reliabilities of 1.0).

The correlation ranged from .72 (Grade 9 science) to .90 (Grade 10 Composite). Most of the disattenuated correlations are greater than .90, suggesting that the PreACT and ACT tests measure similar constructs. Because the correlation coefficients are very large, the findings indicate that PreACT scores are very strong predictors of ACT scores, supporting the use of PreACT and PreACT Secure scores as predictors of ACT scores.

**Table 7.3. Correlations of PreACT and 11th-Grade ACT Scores**

PreACT grade	Test Section	PreACT		ACT		<i>r</i>	<i>r<sub>dis</sub></i>
		Mean	SD	Mean	SD		
9	English	16.7	5.7	20.5	7.1	0.80	0.90
	Math	18.0	4.1	20.3	5.5	0.80	0.92
	Reading	19.5	6.3	21.4	6.9	0.74	0.87
	Science	18.1	4.9	20.8	5.7	0.72	0.83

	Composite	18.4	5.0	19.7	5.6	0.90	0.93

### 7.4.2 Relationship With High School Coursework and Grades

Because PreACT Secure measures skills that are taught in school and that are related to major curriculum areas, students who perform better in high school courses should generally perform better on PreACT Secure. Further, performance on PreACT Secure should be an indicator of readiness for advanced high school coursework. To test these propositions, we examined data from students who took PreACT in 10th grade and who reported their high school grades and coursework when they took the ACT in 11th grade.

Table 7.4 presents correlations between PreACT test scores and high school grade averages. The correlations are based on data collected through the spring of 2022 for students who took PreACT in the fall of 10th grade and the ACT in the spring of 11th grade. Overall high school grade point average (GPA) was calculated based on students' self-reported grades in core subject areas (English, math, social studies, and natural science). Subject-area GPAs were calculated using the courses within each of the four core subject areas. Correlations between GPAs and test scores from the same subject area were examined (PreACT reading scores were used for social studies courses).

The correlations are presented for the total group ("All students") and for student groups defined by gender, race/ethnicity, and other group indicators (English language learner, special education, and free/reduced-price lunch eligible). The results of Table 7.4 are summarized as follows:

- PreACT Composite score and overall HSGPA as of Grade 11 are highly correlated ( $r = .57$ ).
- PreACT Composite score and overall HSGPA correlations are similar across gender and racial/ethnic groups, and also similar for English language learners and students eligible for free/reduced-price lunch.

- Correlations between PreACT scores and high school grade averages are smaller for students in special education.
- Correlations between PreACT scores and high school grade averages are the highest in math and English.

**Table 7.4. Correlations of PreACT Scores with High School Grade Averages (HSGPA and Subject-Specific GPAs), by Student Group**

Student group	N	High school subject area / PreACT test score					
		Overall/ Composite	English/ English	Math/ Math	Social studies/ Reading	Natural science/ Science	
All students	244,116	0.57	0.48	0.49	0.42	0.45	
Gender	Female	130,487	0.57	0.46	0.48	0.41	0.44
	Male	111,179	0.59	0.48	0.52	0.43	0.47
Race/ ethnicity	African American	27,742	0.50	0.40	0.39	0.36	0.33
	Asian	8,446	0.55	0.43	0.48	0.39	0.44
	Hispanic	27,742	0.55	0.45	0.45	0.41	0.42
	Other	21,242	0.53	0.44	0.45	0.38	0.41
	White	157,359	0.55	0.45	0.48	0.40	0.43
English language learner	28,436	0.51	0.41	0.42	0.36	0.37	
Special education	3,415	0.34	0.25	0.26	0.25	0.23	
Free/reduced lunch eligible	4,652	0.50	0.42	0.40	0.35	0.39	

When students register for the ACT, they are asked whether they are enrolled in advanced placement, accelerated, or honors courses in each core subject area. Students who perform well in advanced high school courses tend to perform better on the ACT and in college. We examined the relationship between PreACT test scores and success in advanced high school courses. For this analysis, the criterion variable was conjunctive: students who earned a B or higher subject-area GPA (3.00 or higher) and enrolled in at least one advanced course in the same subject area achieved “successful advanced course-taking.”

The probabilities of successful advanced course-taking are graphed in Figure 7.2. The probabilities were estimated using logistic regression and are provided for each core subject area (English, math, social studies, and natural science). Successful advanced course-taking and test scores from the same subject area were examined (PreACT reading scores were used for social studies courses). The probabilities were estimated using data collected through the spring of 2022 for a sample of approximately 185,000 students who took PreACT in the fall of 10th grade and the ACT in the spring of 11th grade.

From Figure 7.2, we see that the probability of successful advanced course-taking increases sharply as PreACT scores increase. The relationship is strongest in math, followed by natural science, English, and social studies. The PreACT test scores associated with a 50% chance of successful advanced course-taking are 17 (English), 19 (math), 22 (reading), and 20 (science).

This evidence supports the use of PreACT and PreACT Secure scores to gauge readiness for advanced high school courses.

**Figure 7.2. Relationship of Grade 10 PreACT Scores and Successful Advanced Course-Taking**

*Note.* Values are plotted for PreACT scores between the 1st and 99th percentile in the sample.

### 7.4.3 Relationship With AP Exam Success

Radunzel and Allen (2020) found that PreACT scores are good predictors of success on AP exams and estimated the PreACT cut scores associated with AP exam success. Data for the study were available for 49,220 students from 318 high schools who had taken at least one AP exam between May of 2015 and May of 2019 and had previously taken ACT® Aspire®, PreACT, or the ACT. A concordance of PreACT/ACT scores with ACT Aspire scores was used to combine data across assessments. Full details of the study are documented in an ACT research report (see Radunzel & Allen, 2020).

The study defined success in AP courses in two ways—receiving an exam score of 3 or higher and receiving an exam score of 4 or higher—and found that PreACT, ACT, and ACT Aspire scores are positively related to AP exam scores and are good predictors of success in future AP courses. The prediction was strengthened by using combined PreACT scores that were aligned to the content of the AP courses. The sum of the English and Reading scores (denoted E+R) was used for ELA-related AP courses, and the STEM score (the average of the math and science scores) was used for STEM-related courses. As a result, the recommended links to AP

exam success were developed in relation to content-relevant scores for most courses (shown in Table 7.5).

For each course and outcome, two cut scores are provided—one for fall and one for spring testing—depending on when students take PreACT or PreACT Secure. For example, the first row of results within the table indicates that students who test in the fall and achieve a PreACT or PreACT Secure E+R score of 42 or higher are likely academically ready to take AP English Language and Composition in the subsequent academic year, as they have a 50% or greater chance of earning a 3 or higher on the corresponding AP exam. Those with a PreACT or PreACT Secure E+R score of 54 or higher have a 50% or greater chance of earning a score of 4 or higher. The AP-ready cut scores derived from spring testing are slightly higher at 45 (for 3 or higher) and 56 (for 4 or higher) to account for the reduced time between PreACT testing and taking the AP exam. Table 7.5 also reports the correlations ( $r$ ) between test scores (PreACT, ACT, or ACT Aspire) and AP exam scores.

For a holistic view of student readiness for AP courses, we recommend using PreACT Secure scores in combination with other readiness measures (e.g., high school coursework taken, high school grades, motivation, and interest).

**Table 7.5. PreACT Scores Associated with Approximately a 50% Chance of Success on AP Exams**

	AP course	N	PreACT score	$r$	3 or higher		4 or higher	
					fall	spring	fall	spring
ELA-related	English Lang. and Composition	22,044	E+R	.71	42	45	54	56
	English Lit. and Composition	21,227	E+R	.73	49	51	61	62
	European History	1,025	E+R	.66	45	49	57	60

	Physics C: E and M	100	STEM	.62	26	28	—	28
	Physics C: Mechanics	413	STEM	.59	25	25	—	28
	Statistics	6,002	STEM	.72	23	24	—	27
Other	Art History	734	Comp.	.50	22	22	—	28
	Music Theory	1,078	Comp.	.56	21	22	—	25
PSAT/SAT-derived	Comparative Govt. and Politics	—	Comp.	—	22	22	—	25
	Computer Science Principles	—	Comp.	—	18	18	—	25

Note. E+R = English + Reading score. Comp. = Composite score

\*Cut scores are not reported for AP Calculus BC. As recommended by College Board as part of AP Potential, students who meet the AP Calculus AB cut scores and perform well in courses leading up to Calculus may consider taking AP Calculus BC.

\*\*Cut scores are not reported for AP Physics 2. As recommended by College Board as part of AP Potential, students who meet the AP Physics 1 cut scores and perform well in prerequisite courses for AP Physics 2 may consider taking AP Physics 2.

## 7.5 Evidence Related to Consequences of Testing

Consequences of testing include those from (a) interpretations and uses of test scores intended by the test developer, (b) claims made about the test that are not directly based on test score, and (c) unintended consequences (AERA et al., 2014). ACT continually seeks evidence of both positive and negative consequences. In this section, we discuss intended consequences of PreACT Secure testing and discuss research that examined the effects of PreACT adoption on college readiness outcomes.

### 7.5.1 *Intended Consequences of PreACT Secure Testing*

As described in [Chapter 1](#), the intended benefits of PreACT Secure are closely related to its intended uses and include the following:

- Students gain exposure to the types of content featured on the ACT and to the ACT testing experience.
- Predicted ACT scores improve understanding of student performance relative to college and career readiness.
- Students, parents, and educators understand relative strengths and weaknesses in four subjects that are also assessed by the ACT.
- Schools and districts gain important insights about curriculum and program effectiveness.
- Educators can identify students who are ready for advanced high school coursework and college courses.
- Students engage in effective college and career exploration and planning.
- Students can better prepare for the ACT (and, more generally, for college and careers).

### 7.5.2 *Effects of PreACT Adoption on College Readiness Outcomes*

A study conducted in 2018 used quasi-experimental methods to examine the effects of schoolwide PreACT adoption on ACT test scores, participation in challenging high school courses, interest-major fit, and college score sending behavior (Allen, 2018). The study found that schoolwide adoption of PreACT led to an increase in ACT Composite score of 0.23 score points, which is comparable to one month of instruction. This effect could be due to exposure to test content and items that mimic those on the ACT (benefit #1), feedback students receive from taking PreACT (benefit #3), changes in instruction or school programming (benefit #4), or improvements in ACT test preparation (benefit #7).

The study also provided evidence of small effects of PreACT adoption on interest-major fit and out-of-state college score sending (benefit #6). Schools that adopted PreACT had students with greater fit between their planned college major and their vocational interests, as well as more students sending their ACT scores to out-of-state colleges.

Further, within schools that adopted PreACT, students who participated in the PreACT Educational Opportunity Service (EOS) were more likely to send their ACT scores to at least four colleges and at least one out-of-state college. Students who completed the PreACT Interest Inventory had slightly higher fit between their interests and planned major when they took the ACT. The study did not provide evidence of PreACT effects on outcomes related to taking challenging high school courses. Students from schools that adopted PreACT were no more likely to take accelerated/AP/honors courses or upper-level elective courses in math or science.

As the PreACT Secure assessment program matures, additional research is needed to examine the consequences of testing.

## Appendix A

### Wisconsin State Supplement: 2022–2023 Achievement Summaries and Test Characteristics

#### Student Participation

WDPI has contracted with ACT to provide all Wisconsin 9<sup>th</sup> and 10<sup>th</sup> grade students an opportunity to participate in a school-day administration of the PreACT Secure test. Self-reported data describing the PreACT Secure examinee population for the 2023 Wisconsin freshman and sophomore classes are presented in Table 1. A list and count of students' approved accommodations are provided in Table 2. Overall, 128,926 students who participated in the state-sponsored spring administration of the PreACT Secure had tests scored. These data are based on the 64,472 9<sup>th</sup> grade and 62,957 10<sup>th</sup> grade Wisconsin students who obtained a Composite score.

**Table 1.** Demographic Characteristics of Wisconsin State Contract Spring 2023 PreACT Secure Examinees

Demographic	9 <sup>th</sup> Grade		10 <sup>th</sup> Grade	
	% <sup>a</sup>	N	% <sup>a</sup>	N
<b>Gender</b>				
Female	46	29,766	46	29,186
Male	50	32,490	50	31,509
Other Gender	3	2,216	4	2,262
<b>Racial-Ethnic Background</b>				
American Indian/Alaska Native	1	543	1	468
Asian	3	2,208	4	2,247
African American/Black	7	4,442	6	3,724
Hispanic/Latino	1	682	1	643
Native Hawaiian/Other Pacific Islander	0	58	0	53
White	60	38,859	62	39,130
Two or more races	11	6,962	11	6,912
Prefer no response/blank	17	10,718	16	9,780

<sup>a</sup> Due to rounding, some columns may not add to exactly 100%.

**Table 2.** List of Accommodations for the 2023 PreACT Secure-Tested 9<sup>th</sup> and 10<sup>th</sup> Grade Classes

Accommodation Description	9 <sup>th</sup>	10 <sup>th</sup>
	N	N
Abacus	5	4
American Sign Language (ASL): Directions Only	17	17
Audio Environment	78	77
Braille EBAE	2	1
Braille UEB with Nemeth Kit	10	4
Braille UEB Math/Science contracted	5	4
Breaks - Supervised within Each Day	1475	1472
Breaks - Securely Extend Session over Multiple Days	1483	1604
Cued Speech	1	1
Extended Time	5589	5895
Home Administration	5	4
Human Reader	31	44
Individual Administration	255	252
Large Type	19	14
Location for movement	155	176
Physical/Motor Equipment	19	9
Readers Script	23	22
Screen Reader	16	13
Scribe	77	74
Signed Exact English (SEE): Directions Only	2	2
Signed Exact English (SEE): Full Translation	1	2
Special Seating/Grouping	5319	5514
Speech to Text	240	186
Text to Speech	3831	3706
Translated Test Instructions Arabic	3	6
Translated Test Instructions Cantonese	6	4
Translated Test Instructions French	3	1
Translated Test Instructions Korean	0	1
Translated Test Instructions Russian	12	10
Translated Test Instructions Spanish	490	520
Translated Test Instructions Tagalog	1	0
Translated Test Instructions Vietnamese	3	7
Visual Environment	18	19
Word-to-Word Dictionary	458	393

**Note:** The totals in Table 2 above reflect all approved accommodations, to include multiple approved accommodations per student.

### Student Performance

Summary statistics in Appendix Table 3 provide an overview of student performance at the overall levels by standard test form as well as the accommodated test forms. Student self-reported demographics are used to show summaries by gender, race/ethnicity, and English language learner status. [Chapter 5](#) provides additional information regarding scoring and reporting including an overview of the score reports and college readiness benchmarks.

**Table 3.** Summary Statistics of the PreACT Secure Test Score Distributions for the Wisconsin Spring 2023 Administration

		Standard Form

### Dimensionality

Exploratory factor analyses were conducted using the Wisconsin spring 2023 administration to explore the dimensionality of constructs measure by the PreACT Secure tests. The PreACT Secure test was developed to measure student development in English, mathematics, reading, and science. Table 7 provides model fit statistics including chi-square, root mean square error of approximation (RMSEA), comparative fit index (CFI), and Tucker-Lewis index (TLI). Factor loadings by subject and reporting category are provided in Table 8.

**Table 7.** Fit Statistics of Models of the PreACT Secure Tests

		Chi square	DF	<i>P</i> -value of Chi-square	RMSEA	CFI	TLI

	White	Hispanic	60	60	0

**Note:** Information in this table can also be found in Table 6.13.

### Reliability and SEM for the PreACT Secure Test Scores

Scale score reliability estimates and SEM for the four PreACT Secure multiple-choice tests (English, mathematics, reading, and science), Composite, and ELA scores are provided in Table 10. These values were calculated based on operational test data from the primary and accommodated test forms administered in the 2022–2023 academic year. See [Chapter 6](#) for additional information regarding reliability and measurement error.

**Table 10.** Scale Score Reliability and SEM for the Wisconsin Spring 2023 PreACT Secure Test Scores

### Classification Consistency

Analyses were conducted to examine the classification consistency on differentiating students into performance levels with the examinees taking the primary test forms administered in Wisconsin in the 2022–2023 academic year. The classification consistencies were calculated using the Livingston and Lewis (1995) method. Table 13 provides the cut scores developed by PreACT Secure and used in these analyses. Additional information regarding PreACT Secure Readiness Levels and Benchmarks can be found in [Chapter 5](#) in Section 5.5 and classification indices can be found in [Chapter 6](#) in Section 6.8.

**Table 13.** PreACT Secure Performance Level Cut Scores for Wisconsin

Test	Grade 9		Grade 10	
	Close to Target	On Target	Close to Target	On Target
English	10	13	12	15
Mathematics	16	18	17	19
Reading	15	18	17	20
Science	16	19	18	20
STEM	20	22	22	24

**Table 14.** Classification Consistency for the Wisconsin Spring 2023 Performance Level Cut Scores
