

Individual Essential Element Descriptions

This document presents the Dynamic Learning Maps[®] (DLM[®]) science Essential Elements (EEs) in a more detailed format to describe how each of the three dimensions is included in that EE, along with the linked Next Generation Science Standards (NGSS) performance expectations (PEs). As described in the file Overview of the DLM Essential Elements for Science, EEs are numbered in a manner similar to NGSS PEs, with a numeral indicating the grade band (i.e., two for grades K–2, five for grades 3–5, eight for grades 6–8, and 12 for grades 9–12), followed by the domain abbreviation (e.g., ESS for Earth and space science, LS for life science, PS for physical science), then a shortened disciplinary core idea (DCI) family name (e.g., SolSys for Earth in the Solar System), and the number within the grade band and family.

The tables presenting the information for each EE correspond to sections in NGSS tables providing similar information about each PE with a few exceptions. Specifically, NGSS includes clarification statements and assessment boundaries for some PEs as well as a connection box that lists other PEs that connect horizontally (within the domain) and vertically (across grade bands) in addition to the Common Core State Standards that are relevant to the PEs. Standards do not typically include these types of information, and they are therefore not part of the Individual EE Descriptions.

The Individual EE Descriptions also differ from the tables presenting the previous DLM science EEs (Dynamic Learning Maps Science Consortium, 2015). The previous tables included linkage level descriptions, which have not yet been developed for the revised set of 84 science EEs because the map development is not yet complete. These previous tables also included links to EEs in mathematics and English language arts, which have not yet been identified for the revised science EEs.

In this section, the tables for each EE include six rows presenting (1) the EE text, (2) the DCI family knowledge, skills, and understandings (KSUs), (3) the science and engineering practices (SEPs), (4) the crosscutting concepts (CCCs), (5) the linked PEs, and (6) articulation of the DCI family across the grade bands.

The first row includes the EE text. This is the standard itself, which describes what students are expected to know, learn, and do for each grade band. EEs are numbered in a manner similar to NGSS PEs, with a numeral indicating the grade band (i.e., two for grades K–2, five for grades 3–5, eight for grades 6–8, and 12 for grades 9–12), followed by the domain abbreviation (e.g., ESS for Earth and space science, LS for life science, PS for physical science), then a shortened DCI family name (e.g., SolSys for Earth in the Solar System), and the number within the grade band and family. For example, the first EE in the list is SCI.EE.2.LS.Org-1, which is for K–2, in life science, the DCI family “Organisms: Structure and Function, Growth, and Development”, and the first EE in that DCI family and grade band.

The second row includes the KSUs within the DCI family that relate to this EE. These KSUs are interrelated concepts that represent the content knowledge relevant to the mastery of the EE. When there is more than one EE within a grade band and DCI family, some of the DCI KSUs will overlap between the EEs.

The third row lists the SEPs used to construct the EE. All EEs will have one or more SEP outlining the practices students can use to develop their scientific thinking and engage with the content described in the DCI KSUs. Under each SEP are descriptions of the ways the SEP could be incorporated in the EE. As described in the file Overview of the DLM Essential Elements for Science, the EE development team selected SEPs to provide meaningful and accessible learning objectives when combined with DCI KSUs.

The selection of SEPs was also designed to provide coverage across different SEPs within the grade band. As described in the *Framework for K–12 Science Education* (National Research Council, 2012) and NGSS (NGSS Lead States, 2013, Appendix F), the eight SEPs are intentionally

interconnected and overlapping. For many EEs, the development team selected multiple SEPs to reflect how science can be taught using multiple practices. Note that the order in which the SEPs are listed follows the ordering in NGSS and should not be interpreted as indicating relevance or importance to the EE.

The fourth row lists the CCCs specified for the EE. Each EE has one or more CCC associated through the DCI content. The NGSS CCCs are described in ways that can be applied across varying levels of complexity. Therefore, the EEs do not include a description of the CCCs at reduced depth, breadth, and complexity as this reduction is accomplished through the other dimensions. As with the NGSS specification of CCCs for the PEs, the lists of CCCs for each EE are not exhaustive and are not intended to limit instruction. The order in which the CCCs are listed also follows the ordering in NGSS.

The fifth row lists the linked NGSS PEs from that grade band. Each EE includes one or more linked PEs that are partially aligned in order to provide educators with context for how related content is intended to be taught and assessed in general education.

The sixth and final row in each table lists all of the EEs from the DCI family, to illustrate how the concepts progress across grade bands.

Students who demonstrate understanding can:

SCI.EE.2.LS.Org-1

Use information to identify that different organisms have different external parts for specific functions.

DLM Disciplinary Core Idea Family

Organisms: Structure and Function, Growth and Development

- Organisms include plants, animals, and humans.
- All animals have external parts that perform daily functions.
- Different animals use their body parts in different ways.
- Plants have different parts (e.g., roots, stems, leaves, flowers, fruits) that help them survive, grow, and produce more plants.

DLM Science and Engineering Practices

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- The shape and stability of structures of natural and designed objects are related to their function(s).

Related NGSS Performance Expectations

1-LS1-1 Use materials to design a solution to a human problem by mimicking how plants and/or animals use their external parts to help them survive, grow, and meet their needs.

2-LS2-2 Develop a simple model that mimics the function of an animal in dispersing seeds or pollinating plants.

2-LS4-1 Make observations of plants and animals to compare the diversity of life in different habitats.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Org-1 Use information to identify that different organisms have different external parts for specific functions.

SCI.EE.5.LS.Org-1 Use information to describe how the parts of organisms help them survive, grow, and reproduce.

SCI.EE.8.LS.Org-1 Provide evidence that living things are made of cells, some of which are unicellular while others are multicellular.

SCI.EE.12.LS.Org-1 Use a model to construct an explanation of how systems of specialized cells within organisms work together to perform essential functions of life.

Students who demonstrate understanding can:

SCI.EE.2.LS.Plant-1 **Investigate what plants need to grow.**

DLM Disciplinary Core Idea Family

Plants: Cycling of Matter and Flow of Energy

- Plants need water and light to grow.
- Plants grow and change.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in K–2 builds on prior experiences and progresses to exploring questions to gain information.

- In exploring how the natural world works, ask questions that lead to observations, descriptions, and explanations.

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in K–2 builds on prior experiences and progresses to simple investigations to collect and use data.

- Collect and compare observations to determine and describe relationships in the natural world.

Analyzing and Interpreting Data: Analyzing data in K–2 builds on prior experiences and progresses to identifying and describing observations and patterns in the natural world.

- Identify and describe patterns in observations and measurements.
- Make classifications and comparisons based on observations and measurements.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Events have causes that generate observable patterns.
- Simple tests can be designed to gather evidence to support or refute student ideas about causes.

Related NGSS Performance Expectations

K-LS1-1 Use observations to describe patterns of what plants and animals (including humans) need to survive.

2-LS2-1 Plan and conduct an investigation to determine if plants need sunlight and water to grow.

2-LS2-2 Develop a simple model that mimics the function of an animal in dispersing seeds or pollinating plants.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Plant-1 Investigate what plants need to grow.

SCI.EE.5.LS.Plant-1 Use data to show that plants use energy (i.e., sunlight) and matter (i.e., air and water) for growth.

SCI.EE.8.LS.Plant-1 Use data to explain that plants use energy (i.e., sunlight) and matter (i.e., air and water) to produce food (i.e., plant matter) for growth.

SCI.EE.12.LS.Plant-1 Use a model to explain the role of plants in the flow of energy and matter among organisms in the ecosystem.

Students who demonstrate understanding can:

SCI.EE.2.LS.Ecosys-1

Use information to support that animals need food to live and grow.

DLM Disciplinary Core Idea Family

Ecosystem: Cycling of Matter and Flow of Energy

- Animals grow and change.
- Animals need food to live and grow.
- Animals get food they need from plants or other animals.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in K–2 builds on prior experiences and progresses to exploring questions to gain information.

- In exploring how the natural world works, ask questions that lead to observations, descriptions, and explanations.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Events have causes that generate observable patterns.
- Simple tests can be designed to gather evidence to support or refute student ideas about causes.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Objects may break into smaller pieces, be put together into larger pieces, or change shapes.

Related NGSS Performance Expectations

K-LS1-1 Use observations to describe patterns of what plants and animals (including humans) need to survive.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Ecosys-1 Use information to support that animals need food to live and grow.

SCI.EE.5.LS.Ecosys-1 Use data to support that food provides animals with the materials and energy they need for body repair, growth, warmth, and motion.

SCI.EE.8.LS.Ecosys-1 Use a model to describe the transfer of food (i.e., matter and energy) between plants, animals, and decomposers.

SCI.EE.12.LS.Ecosys-1 Develop a model that describes how matter (plant or animal matter) and energy (i.e., sunlight and food energy) are cycled within an ecosystem.

Students who demonstrate understanding can:

SCI.EE.2.LS-EcoHlth-1

Use information to describe that many kinds of living things live in different habitats.

DLM Disciplinary Core Idea Family

Ecosystem Health

- There are many different kinds of living things, and they live in different places.
- Living things need resources (e.g., water, air, and land) to live; living things live where they can find these resources.
- A habitat meets all the environmental conditions an organism needs to survive.

DLM Science and Engineering Practices

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Objects and organisms can be described in terms of their parts.
- Systems in the natural and designed world have parts that work together.

Related NGSS Performance Expectations

2-LS4-1 Make observations of plants and animals to compare the diversity of life in different habitats.

K-ESS3-1 Use a model to represent the relationship between the needs of different plants or animals (including humans) and the places they live.

K-PS3-1 Make observations to determine the effect of sunlight on Earth’s surface.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.EcoHlth-1 Use information to describe that many kinds of living things live in different habitats.

SCI.EE.5.LS.EcoHlth-1 Use information to support that healthy ecosystems meet the needs of many varieties and types of organisms.

SCI.EE.5.LS.EcoHlth-2 Ask questions to determine how living things (both plants and animals) impact the habitat in which they live.

SCI.EE.8.LS.EcoHlth-1 Use data to explain the relationship between organisms’ survival and growth and their interactions with both living and nonliving factors in their ecosystem.

SCI.EE.12.LS.EcoHlth-1 Use data to make an argument about the effects of unstable environments on the health of ecosystems.

Students who demonstrate understanding can:

SCI.EE.2.LS.Group-1

Use information to identify that offspring learn survival behaviors.

DLM Disciplinary Core Idea Family

Group Survival Behavior

- Animals use their senses to gain information.
- Adult animals can have young (i.e., offspring).
- Offspring learn behaviors from parents that help them survive. Offspring also learn from other family members, community members, and past experience.
- Parents behave in ways to help their offspring survive.
- Behaviors can include protecting, nesting, feeding, hunting, cleaning, grooming, migrating, etc.

DLM Science and Engineering Practices

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Events have causes that generate observable patterns.
- Simple tests can be designed to gather evidence to support or refute student ideas about causes.

Related NGSS Performance Expectations

K-LS1-1 Use observations to describe patterns of what plants and animals (including humans) need to survive.

1-LS1-1 Use materials to design a solution to a human problem by mimicking how plants and/or animals use their external parts to help them survive, grow, and meet their needs.

1-LS1-2 Read texts and use media to determine patterns in behavior of parents and offspring that help offspring survive.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Group-1 Use information to identify that offspring learn survival behaviors.

SCI.EE.5.LS.Group-1 Provide evidence that animals gain information for survival through their senses.

SCI.EE.8.LS.Group-1 Use information to explain the relationship between animals' abilities to sense and communicate information and the response behaviors that help them grow and survive.

SCI.EE.12.LS.Group-1 Use data to support a claim about how group behavior affects individuals' and species' chances to survive.

Students who demonstrate understanding can:

SCI.EE.2.LS.Trait-1

Use information to show that organisms (both plants and animals) may resemble their biological parents but are not identical to their parents.

DLM Disciplinary Core Idea Family

Traits of Organisms

- Young plants and animals are similar, not identical, to their parents.
- Characteristics of individuals of the same kind can vary.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in K–2 builds on prior experiences and progresses to identifying and describing observations and patterns in the natural world.

- Identify and describe patterns in observations and measurements.
- Make classifications and comparisons based on observations and measurements.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Related NGSS Performance Expectations

1-LS3-1 Make observations to construct an evidence-based account that young plants and animals are like, but not exactly like, their parents.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Trait-1 Use information to show that organisms (both plants and animals) may resemble their biological parents but are not identical to their parents.

SCI.EE.5.LS.Trait-1 Use information to describe that different organisms vary in how they look due to the traits passed down from their parents.

SCI.EE.8.LS.Trait-1 Use information to determine how the environment affects organisms' traits and their survival.

SCI.EE.12.LS.Trait-1 Use information to support a claim that heredity and the environment influence the traits of an individual.

SCI.EE.12.LS.Trait-2 Use mathematical reasoning to support relationships between changing environmental conditions, adaptation by natural selection, and changes in the distribution of traits within a population.

Students who demonstrate understanding can:

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- We live on a planet called Earth.
- From Earth, the Sun, other stars, and the Moon (i.e., celestial objects) can be seen in the sky.
- Stars give off light.
- The Sun, which is a star, provides light during the daytime. Daily, the Sun appears to rise in the morning and set in the evening.
- Except for the Sun, stars can mainly be seen in the sky at nighttime.
- Earth’s Moon can mainly be seen in the sky at nighttime. It looks different than stars.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in K–2 builds on prior experiences and progresses to simple investigations to collect and use data.

- Collect and compare observations to determine and describe relationships in the natural world.

Analyzing and Interpreting Data: Analyzing data in K–2 builds on prior experiences and progresses to identifying and describing observations and patterns in the natural world.

- Identify and describe patterns in observations and measurements.
- Make classifications and comparisons based on observations and measurements.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Related NGSS Performance Expectations

1-ESS1-1 Use observations of the sun, moon, and stars to describe patterns that can be predicted.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth’s gravity exerts a downward force on all objects on its surface.

SCI.EE.8.ESS.SolSys-1 Use models to compare the components of our solar system and describe the motions of those components.

SCI.EE.8.ESS.SolSys-2 Use a model of the Sun-Earth-Moon system to explain the relationship between the motion of the Moon and the cyclical patterns of its phases.

SCI.EE.8.ESS.SolSys-3 Use a model to explain the relationships between the orientation of Earth’s axis in relation to the Sun, Earth’s motion, and seasonal patterns in the number of daylight hours.

SCI.EE.8.ESS.SolSys-4 Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

SCI.EE.12.ESS.SolSys-1 Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star’s mass and distance from Earth.

SCI.EE.12.ESS.SolSys-2 Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth’s surface and seasonal temperature patterns.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth’s surface.

DLM Disciplinary Core Idea Family

Earth Systems

- Water is found in the ocean, rivers, lakes, ponds, streams, ice caps, and glaciers.
- Water exists as solid ice and in liquid form.

DLM Science and Engineering Practices

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Related NGSS Performance Expectations

2-ESS2-2 Develop a model to represent the shapes and kinds of land and bodies of water in an area.

2-ESS2-3 Obtain information to identify where water is found on Earth and that it can be solid or liquid.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth’s surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth’s surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth’s spheres can cause changes to other Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth’s systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.2.ESS.Earth-2

Use observations to describe that wind and water can change the shape of the land.

DLM Disciplinary Core Idea Family

Earth Systems

- Water is found in the ocean, rivers, lakes, ponds, streams, ice caps, and glaciers (see SCI.EE.2.ESS-Earth-1).
- Water and wind can change the shape of land.
 - Water carries soil and rocks from one place to another.
 - Wind carries soil from one place to another and wears down rock.
- The change in the shape of land can occur quickly or slowly.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in K–2 builds on prior experiences and progresses to simple investigations to collect and use data.

- Collect and compare observations to determine and describe relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Events have causes that generate observable patterns.
- Simple tests can be designed to gather evidence to support or refute student ideas about causes.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Some things stay the same while other things change.
- Things may change slowly or rapidly.

Related NGSS Performance Expectations

2-ESS1-1 Use information from several sources to provide evidence that Earth events can occur quickly or slowly.

2-ESS2-1 Compare multiple solutions designed to slow or prevent wind or water from changing the shape of the land.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth’s surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth’s surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth’s spheres can cause changes to other Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth’s systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.2.ESS.Weath-1 Use local weather condition data to describe patterns over time.

DLM Disciplinary Core Idea Family

Weather and Climate

- Weather is the combination of sunlight, wind, snow or rain, and temperature in a particular region at a particular time.
- “Local” refers to a localized area for weather data, not necessarily the location of the student.
- Recorded measurements or observations of weather conditions can be used to notice patterns over time.
 - The time scale includes a day (a.m. versus p.m.), days, months, seasons, and years (but no more than a two-decade time span).

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in K–2 builds on prior experiences and progresses to identifying and describing observations and patterns in the natural world.

- Identify and describe patterns in observations and measurements.
- Make classifications and comparisons based on observations and measurements.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Related NGSS Performance Expectations

K-ESS2-1 Use and share observations of local weather conditions to describe patterns over time.

K-ESS3-2 Ask questions to obtain information about the purpose of weather forecasting to prepare for, and respond to, severe weather.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Weath-1 Use local weather condition data to describe patterns over time.

SCI.EE.5.ESS.Weath-1 Determine patterns in weather data to help predict future weather.

SCI.EE.8.ESS.Weath-1 Determine the weather data needed to describe patterns in the movement of air masses that likely cause changes in weather.

SCI.EE.8.ESS.Weath-2 Use information to describe the relationships between regional climates, locations on Earth, geographic features, and weather.

SCI.EE.12.ESS.Weath-1 Use data to determine the relationship between the absorption of the Sun’s energy by Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere) and trends in average global temperature.

SCI.EE.12.ESS.Weath-2 Ask questions to describe the relationship between human activity and global average temperature.

Students who demonstrate understanding can:

SCI.EE.2.ESS.Impact-1 **Use information to identify the impacts of severe weather on humans.**

DLM Disciplinary Core Idea Family

Reducing Impacts of Severe Weather

- Severe weather can cause people harm (see SCI.EE.2.ESS-Weath-1).
 - Harmful impacts could include loss of shelter, access to food, power, etc.
- Severe weather is forecasted so people can prepare and respond.
- A situation that people want to change or create can be approached as a problem to be solved.
- Before solving a problem, it is important to clearly understand the problem.
- Asking questions, making observations, and gathering information help to understand problems.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in K–2 builds on prior experiences and progresses to exploring questions to gain information.

- In exploring how the natural world works, ask questions that lead to observations, descriptions, and explanations.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Events have causes that generate observable patterns.
- Simple tests can be designed to gather evidence to support or refute student ideas about causes.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Some things stay the same while other things change.
- Things may change slowly or rapidly.

Related NGSS Performance Expectations

K-ESS2-1 Use and share observations of local weather conditions to describe patterns over time.

K-ESS3-2 Ask questions to obtain information about the purpose of weather forecasting to prepare for, and respond to, severe weather.

2-ESS1-1 Use information from several sources to provide evidence that Earth events can occur quickly or slowly.

K-2-ETS1-1 Ask questions, make observations, and gather information about a situation people want to change to define a simple problem that can be solved through the development of a new or improved object or tool.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Impact-1 Use information to identify the impacts of severe weather on humans.

SCI.EE.5.ESS.Impact-1 Explain how a design solution reduces the impacts of severe weather on humans.

SCI.EE.8.ESS.Impact-1 Evaluate solutions that reduce the impacts of severe weather on humans.

SCI.EE.12.ESS.Impact-1 Improve a solution that reduces the impacts of severe weather on humans.

Students who demonstrate understanding can:

SCI.EE.2.PS.Matter-1 **Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.**

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Different kinds of matter exist (e.g., wood, metal, water), and many of them can be either solid or liquid, depending on temperature.
- Matter can be described and classified by its observable properties.
- Different properties are suited to different purposes.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in K–2 builds on prior experiences and progresses to exploring questions to gain information.

- In exploring how the natural world works, ask questions that lead to observations, descriptions, and explanations.

Analyzing and Interpreting Data: Analyzing data in K–2 builds on prior experiences and progresses to identifying and describing observations and patterns in the natural world.

- Identify and describe patterns in observations and measurements.
- Make classifications and comparisons based on observations and measurements.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in K–2 builds on prior experiences and uses observations and other media to identify scientific ideas.

- Use observations, images, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, maps) to answer questions and identify scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Objects may break into smaller pieces, be put together into larger pieces, or change shapes.

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- The shape and stability of structures of natural and designed objects are related to their function(s).

Related NGSS Performance Expectations

2-PS1-1 Plan and conduct an investigation to describe and classify different kinds of materials by their observable properties.

2-PS1-2 Analyze data obtained from testing different materials to determine which materials have the properties that are best suited for an intended purpose.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Matter-1 Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.

SCI.EE.5.PS.Matter-1 Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

SCI.EE.5.PS.Matter-2 Use evidence to support a claim that matter exists even when it cannot be seen.

SCI.EE.8.PS.Matter-1 Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.

SCI.EE.8.PS.Matter-2 Gather and use data to support the law of conservation of mass when substances change.

SCI.EE.8.PS.Matter-3 Gather and use data to determine whether an interaction between substances results in the formation of a new substance.

SCI.EE.12.PS.Matter-1 Use a model to describe that substances are made of different types and numbers of atoms.

SCI.EE.12.PS.Matter-2 Use a model to describe that in chemical reactions, the atoms in the starting substances (i.e., the reactants) rearrange to form new substances (i.e., the products).

SCI.EE.12.PS.Matter-3 Based on data, describe how the temperature and amount (i.e., concentration) of reacting substances affect the rates of chemical reactions.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.2.PS.Forces-1

Make observations to compare the effects of different strengths and directions of pushes and pulls on the motion of an object.

DLM Disciplinary Core Idea Family

Interacting Forces

- Pushes and pulls can have different strengths and directions.
- The motion of an object depends on the pushes and pulls on that object.
 - Pushing or pulling on an object can change the speed or direction of its motion and can start or stop it.
 - Pushes and pulls can keep an object in place.
 - A stronger (or bigger) push or pull makes things go faster.
- When objects collide, they push on one another.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in K–2 builds on prior experiences and progresses to exploring questions to gain information.

- In exploring how the natural world works, ask questions that lead to observations, descriptions, and explanations.

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in K–2 builds on prior experiences and progresses to simple investigations to collect and use data.

- Collect and compare observations to determine and describe relationships in the natural world.

Analyzing and Interpreting Data: Analyzing data in K–2 builds on prior experiences and progresses to identifying and describing observations and patterns in the natural world.

- Identify and describe patterns in observations and measurements.
- Make classifications and comparisons based on observations and measurements.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Patterns in the natural and human designed world can be observed, used to describe phenomena, and used as evidence.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Events have causes that generate observable patterns.
- Simple tests can be designed to gather evidence to support or refute student ideas about causes.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- Relative scales allow objects and events to be compared and described (e.g., bigger and smaller; hotter and colder; faster and slower).
- Standard units are used to measure length.

Related NGSS Performance Expectations

K-PS2-1 Plan and conduct an investigation to compare the effects of different strengths or different directions of pushes and pulls on the motion of an object.

K-PS2-2 Analyze data to determine if a design solution works as intended to change the speed or direction of an object with a push or a pull.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Forces-1 Make observations to compare the effects of different strengths and directions of pushes and pulls on the motion of an object.

SCI.EE.5.PS.Forces-1 Make observations to determine the effects of balanced and unbalanced forces on the motion (i.e., speed and direction) of an object.

SCI.EE.5.PS.Forces-2 Provide evidence that some objects (e.g., magnets, metals, pith balls, objects falling toward Earth) exert forces on each other even when the objects are not in contact.

SCI.EE.8.PS.Forces-1 Use observations and measurements to determine how an object's mass affects the force needed to change its motion.

SCI.EE.8.PS.Forces-2 Make observations of the motion of two colliding objects to provide evidence of Newton's third law.

SCI.EE.12.PS.Forces-1 Conduct an investigation to describe the relationships between force, mass, and acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.2.PS.Energy-1

Make observations that energy exists.

DLM Disciplinary Core Idea Family

Energy

- Energy is how things change, grow, and move.
- Evidence of the presence of energy includes moving objects, sound, light, or heat (e.g., a rolling marble, hearing or feeling a sound, feeling warmth from the Sun or light source, seeing light from a light bulb or flame).

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in K–2 builds on prior experiences and progresses to simple investigations to collect and use data.

- Collect and compare observations to determine and describe relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Objects may break into smaller pieces, be put together into larger pieces, or change shapes.

Related NGSS Performance Expectations

K-PS3-1 Make observations to determine the effect of sunlight on Earth’s surface.

1-PS4-2 Make observations to construct an evidence-based account that objects in darkness can be seen only when illuminated.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Energy-1 Make observations that energy exists.

SCI.EE.5.PS.Energy-1 Use observations to support a claim about the amount of energy moved from one place to another by sound, light, heat, and moving objects.

SCI.EE.8.PS.Energy-1 Develop a model to infer the relationship between the kinetic energy and temperature of an object or particles of a substance.

SCI.EE.8.PS.Energy-2 Provide evidence that kinetic energy is transferred between two objects when they collide with each other.

SCI.EE.8.PS.Energy-3 Develop a model to describe the behavior of light (i.e., transmission, reflection, scattering) that comes into contact with objects made of different materials.

SCI.EE.12.PS.Energy-1 Gather data to describe the thermal energy transfer between two objects or substances in contact with each other.

SCI.EE.12.PS.Energy-2 Ask questions to describe the relationship between sound energy and the vibrations of particles of matter.

Students who demonstrate understanding can:

SCI.EE.5.LS.Org-1

Use information to describe how the parts of organisms help them survive, grow, and reproduce.

DLM Disciplinary Core Idea Family

Organisms: Structure and Function, Growth and Development

- Plants and animals have both internal and external structures for growth, survival, and behavior (major structures at the macroscale level and not the cellular level).
- Organisms have unique and diverse life cycles.
- All living things must reproduce in order for the species to survive.

DLM Science and Engineering Practices

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.
- Use information to determine and explain cause-and-effect relationships in the designed world.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- Different materials have different substructures, which can sometimes be observed.
- Substructures have shapes and parts that serve functions.

Related NGSS Performance Expectations

3-LS4-2 Use evidence to construct an explanation for how the variations in characteristics among individuals of the same species may provide advantages in surviving, finding mates, and reproducing.

4-LS1-1 Construct an argument that plants and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.

3-LS1-1 Develop models to describe that organisms have unique and diverse life cycles but all have in common birth, growth, reproduction, and death.

4-LS1-2 Use a model to describe that animals receive different types of information through their senses, process the information in their brain, and respond to the information in different ways.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Org-1 Use information to identify that different organisms have different external parts for specific functions.

SCI.EE.5.LS.Org-1 Use information to describe how the parts of organisms help them survive, grow, and reproduce.

SCI.EE.8.LS.Org-1 Provide evidence that living things are made of cells, some of which are unicellular while others are multicellular.

SCI.EE.12.LS.Org-1 Use a model to construct an explanation of how systems of specialized cells within

organisms work together to perform essential functions of life.

Students who demonstrate understanding can:

SCI.EE.5.LS.Plant-1 **Use data to show that plants use energy (i.e., sunlight) and matter (i.e., air and water) for growth.**

DLM Disciplinary Core Idea Family

Plants: Cycling of Matter and Flow of Energy

- Plants acquire materials for growth mainly from the air and water, and process matter and obtain energy from sunlight, which is used for body repair and growth.
- Organisms get gases (air) and water from the environment.
- (Stored) Energy in plant matter is used for body repair and growth.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is made of particles.
- Matter flows and cycles can be tracked in terms of the weight of the substances before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.
- Energy can be transferred in various ways and between objects.

Related NGSS Performance Expectations

5-LS1-1 Support an argument that plants get the materials they need for growth chiefly from air and water.

5-LS2-1 Develop a model to describe the movement of matter among plants, animals, decomposers, and the environment.

5-PS3-1 Use models to describe that energy in animals’ food (used for body repair, growth, motion, and to maintain body warmth) was once energy from the sun.

5-ESS2-1 Develop a model using an example to describe ways the geosphere, biosphere, hydrosphere, and/or atmosphere interact.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Plant-1 Investigate what plants need to grow.

SCI.EE.5.LS.Plant-1 Use data to show that plants use energy (i.e., sunlight) and matter (i.e., air and water) for

growth.

SCI.EE.8.LS.Plant-1 Use data to explain that plants use energy (i.e., sunlight) and matter (i.e., air and water) to produce food (i.e., plant matter) for growth.

SCI.EE.12.LS.Plant-1 Use a model to explain the role of plants in the flow of energy and matter among organisms in the ecosystem.

Students who demonstrate understanding can:

SCI.EE.5.LS.Ecosys-1

Use data to support that food provides animals with the materials and energy they need for body repair, growth, warmth, and motion.

DLM Disciplinary Core Idea Family

Ecosystem: Cycling of Matter and Flow of Energy

- Animals acquire matter and energy from their environment.
- Organisms live where they can find enough food.
- Some animals eat plants for food and other animals eat the animals that eat plants.
- Food provides animals with the materials they need for body repair, growth, warmth, and motion.
- Energy stored in food can be used for body repair, growth, warmth, and motion.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is made of particles.
- Matter flows and cycles can be tracked in terms of the weight of the substances before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.
- Energy can be transferred in various ways and between objects.

Related NGSS Performance Expectations

3-LS1-1 Develop models to describe that organisms have unique and diverse life cycles but all have in common birth, growth, reproduction, and death.

5-LS2-1 Develop a model to describe the movement of matter among plants, animals, decomposers, and the environment.

5-PS3-1 Use models to describe that energy in animals’ food (used for body repair, growth, motion, and to maintain body warmth) was once energy from the sun.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Ecosys-1 Use information to support that animals need food to live and grow.

SCI.EE.5.LS.Ecosys-1 Use data to support that food provides animals with the materials and energy they need for body repair, growth, warmth, and motion.

SCI.EE.8.LS.Ecosys-1 Use a model to describe the transfer of food (i.e., matter and energy) between plants, animals, and decomposers.

SCI.EE.12.LS.Ecosys-1 Develop a model that describes how matter (plant or animal matter) and energy (i.e., sunlight and food energy) are cycled within an ecosystem.

Students who demonstrate understanding can:

SCI.EE.5.LS.EcoHlth-1

Use information to support that healthy ecosystems meet the needs of many varieties and types of organisms.

DLM Disciplinary Core Idea Family

Ecosystem Health

- Healthy ecosystems are places where organisms live and can find enough food, water, space, and a place to raise their young.
- Healthy ecosystems have a diversity of plants and animals in a fairly stable environment.
- Healthy ecosystems provide a way for pollination and seed dispersal to occur.
 - Plants depend on seed dispersal and pollination.
 - Seeds are dispersed by wind, water, and animals.
 - Plant pollination occurs by wind, water, and animals.
- Healthy ecosystems meet the survival needs of diverse organisms.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

System and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- A system is a group of related parts that make up a whole and can carry out functions its individual parts cannot.
- A system can be described in terms of its components and their interactions.

Related NGSS Performance Expectations

3-LS4-3 Construct an argument with evidence that in a particular habitat some organisms can survive well, some survive less well, and some cannot survive at all.

3-LS4-4 Make a claim about the merit of a solution to a problem caused when the environment changes and the types of plants and animals that live there may change.

5-ESS2-1 Develop a model using an example to describe ways the geosphere, biosphere, hydrosphere, and/or atmosphere interact.

3-ESS2-2 Obtain and combine information to describe climates in different regions of the world.

5-ESS3-1 Obtain and combine information about ways individual communities use science ideas to protect the Earth’s resources and environment.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.EcoHlth-1 Use information to describe that many kinds of living things live in different habitats.

SCI.EE.5.LS.EcoHlth-1 Use information to support that healthy ecosystems meet the needs of many varieties and types of organisms.

SCI.EE.5.LS.EcoHlth-2 Ask questions to determine how living things (both plants and animals) impact the habitat in which they live.

SCI.EE.8.LS.EcoHlth-1 Use data to explain the relationship between organisms’ survival and growth and their interactions with both living and nonliving factors in their ecosystem.

SCI.EE.12.LS.EcoHlth-1 Use data to make an argument about the effects of unstable environments on the health of ecosystems.

Students who demonstrate understanding can:

SCI.EE.5.LS.EcoHlth-2

Ask questions to determine how living things (both plants and animals) impact the habitat in which they live.

DLM Disciplinary Core Idea Family

Ecosystem Health

- Healthy ecosystems have a diversity of plants and animals in a fairly stable environment.
- Organisms live where they can find enough food, water, space, and place to raise their young.
- Living things can impact the physical characteristics of where they live.
 - Animals aid in plant pollination and seed dispersal.
 - Impacts can be positive or negative.
- Populations live in a variety of habitats and change in those habitats affects the organisms living there.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 3–5 builds on K–2 experiences and progresses to identifying questions to gain information through investigation.

- Develop questions that can help determine cause-and-effect relationships.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

System and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- A system is a group of related parts that make up a whole and can carry out functions its individual parts cannot.
- A system can be described in terms of its components and their interactions.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Change is measured in terms of differences over time and may occur at different rates.
- Some systems appear stable, but over long periods of time will eventually change.

Related NGSS Performance Expectations

3-LS4-3 Construct an argument with evidence that in a particular habitat some organisms can survive well, some survive less well, and some cannot survive at all.

3-LS4-4 Make a claim about the merit of a solution to a problem caused when the environment changes and the types of plants and animals that live there may change.

4-ESS2-1 Make observations and/or measurements to provide evidence of the effects of weathering or the rate of erosion by water, ice, wind, or vegetation.

5-ESS2-1 Develop a model using an example to describe ways the geosphere, biosphere, hydrosphere, and/or atmosphere interact.

5-ESS3-1 Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.EcoHlth-1 Use information to describe that many kinds of living things live in different habitats.

SCI.EE.5.LS.EcoHlth-1 Use information to support that healthy ecosystems meet the needs of many varieties and types of organisms.

SCI.EE.5.LS.EcoHlth-2 Ask questions to determine how living things (both plants and animals) impact the habitat in which they live.

SCI.EE.8.LS.EcoHlth-1 Use data to explain the relationship between organisms' survival and growth and their interactions with both living and nonliving factors in their ecosystem.

SCI.EE.12.LS.EcoHlth-1 Use data to make an argument about the effects of unstable environments on the health of ecosystems.

Students who demonstrate understanding can:

SCI.EE.5.LS.Group-1 **Provide evidence that animals gain information for survival through their senses.**

DLM Disciplinary Core Idea Family

Group Survival Behavior

- Animals, including people, use their senses to learn about the world around them and guide their actions.
- Animals receive light and sound information. Their brains process that information and help them respond with survival behaviors.
 - Sound can make matter vibrate, and vibrating matter can make sound (see SCI.EE.5.PS.Energy-1).
 - Objects can be seen when light reflects from the surface of the object and enters the eyes (see SCI.EE.5.PS.Energy-1).
- People and animals share (i.e., communicate) important information with other members of their group or family.

DLM Science and Engineering Practices

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

System and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- A system is a group of related parts that make up a whole and can carry out functions its individual parts cannot.
- A system can be described in terms of its components and their interactions.

Related NGSS Performance Expectations

4-LS1-1 Construct an argument that plants and animals have internal and external structures that function to support survival, growth, behavior, and reproduction.

4-LS1-2 Use a model to describe that animals receive different types of information through their senses, process the information in their brain, and respond to the information in different ways.

3-LS2-1 Construct an argument that some animals form groups that help members survive.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Group-1 Use information to identify that offspring learn survival behaviors.

SCI.EE.5.LS.Group-1 Provide evidence that animals gain information for survival through their senses.

SCI.EE.8.LS.Group-1 Use information to explain the relationship between animals' abilities to sense and communicate information and the response behaviors that help them grow and survive.

SCI.EE.12.LS.Group-1 Use data to support a claim about how group behavior affects individuals' and species' chances to survive.

Students who demonstrate understanding can:

SCI.EE.5.LS.Trait-1

Use information to describe that different organisms vary in how they look due to the traits passed down from their parents.

DLM Disciplinary Core Idea Family

Traits of Organisms

- Offspring acquire a mix of traits from their biological parents.
- Organisms resemble their parents and other organisms of the same kind.
- Organisms (both plants and animals) have characteristics that can be similar or different.
- Different organisms vary in how they look and function because they have different inherited information.
- Different characteristics (i.e., differences in phenotype) help individuals survive.

DLM Science and Engineering Practices

Constructing Explanation and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.
- Patterns can be used as evidence to support explanation.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Related NGSS Performance Expectations

3-LS3-1 Analyze and interpret data to provide evidence that plants and animals have traits inherited from parents and that variation of these traits exists in a group of similar organisms.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Trait-1 Use information to show that organisms (both plants and animals) may resemble their biological parents but are not identical to their parents.

SCI.EE.5.LS.Trait-1 Use information to describe that different organisms vary in how they look due to the traits passed down from their parents.

SCI.EE.8.LS.Trait-1 Use information to determine how the environment affects organisms' traits and their survival.

SCI.EE.12.LS.Trait-1 Use information to support a claim that heredity and the environment influence the traits of an individual.

SCI.EE.12.LS.Trait-2 Use mathematical reasoning to support relationships between changing environmental conditions, adaptation by natural selection, and changes in the distribution of traits within a population.

Students who demonstrate understanding can:

SCI.EE.5.LS.Human-1

Use information to describe how humans impact a variety of ecosystems.

DLM Disciplinary Core Idea Family

Human Impacts on Ecosystems

- Humans live in many different kinds of ecosystems.
- Change in a habitat affects the organisms living there.
- Humans live where they can find enough food, water, space, and other natural resources.
 - Healthy ecosystems have a diversity of plants and animals in a fairly stable environment.
 - Humans' use of energy and fuels comes from natural sources. Use of resources impacts the ecosystem.
- Humans live in a variety of habitats and their activities impact those habitats. Impacts can be positive or negative.
- There are changes we humans can make to reduce negative or increase positive impacts.
- A situation that people want to change or create can be approached as a problem to be solved.
- Before solving a problem, it is important to clearly understand the problem.
- Asking questions, making observations, and gathering information help to understand problems.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 3–5 builds on K–2 experiences and progresses to identifying questions to gain information through investigation.

- Develop questions that can help determine cause-and-effect relationships.

Constructing Explanation and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.
- Use information to determine and explain cause-and-effect relationships in the designed world.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- A system is a group of related parts that make up a whole and can carry out functions its individual parts cannot.
- A system can be described in terms of its components and their interactions.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Change is measured in terms of differences over time and may occur at different rates.
- Some systems appear stable, but over long periods of time will eventually change.

Related NGSS Performance Expectations

3-5-ETS1-1 Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time, or cost.

3-5-ETS1-2 Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.

3-LS4-3 Construct an argument with evidence that in a particular habitat some organisms can survive well, some survive less well, and some cannot survive at all.

3-LS4-4 Make a claim about the merit of a solution to a problem caused when the environment changes and the types of plants and animals that live there may change.

4-ESS3-1 Obtain and combine information to describe that energy and fuels are derived from natural resources and their uses affect the environment.

5-ESS3-1 Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.

Articulation of the DCI Family Across Grade Bands

SCI.EE.5.LS.Human-1 Use information to describe how humans impact a variety of ecosystems.

SCI.EE.8.LS.Human-1 Define problems caused by human activities on ecosystems.

SCI.EE.12.LS.Human-1 Evaluate design solutions that minimize the effects of human activities on the health of ecosystems.

Students who demonstrate understanding can:

SCI.EE.5.ESS.SolSys-1 **Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.**

DLM Disciplinary Core Idea Family

Earth in the Solar System

- The Sun, a star, gives off light.
- Light transfers energy from one place (i.e., a star or the Sun) to another (i.e., Earth) (see SCI.EE.5.PS-Energy-1).
- The Sun is one of many stars that can be seen in the sky.
- The Sun appears as the largest and brightest star in the sky because it is closest to Earth.
- The other stars (i.e., suns) may be larger or smaller than the Sun, but they are farther away and appear dimmer.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- Natural objects and/or observable phenomena exist from the very small to the immensely large or from very short to very long time periods.
- Standard units are used to measure and describe physical quantities such as weight, time, temperature, and volume.

Related NGSS Performance Expectations

5-ESS1-1 Support an argument that differences in the apparent brightness of the sun compared to other stars is due to their relative distances from Earth.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth's gravity exerts a downward force on all objects on its surface.

SCI.EE.8.ESS.SolSys-1 Use models to compare the components of our solar system and describe the motions of those components.

SCI.EE.8.ESS.SolSys-2 Use a model of the Sun-Earth-Moon system to explain the relationship between the motion of the Moon and the cyclical patterns of its phases.

SCI.EE.8.ESS.SolSys-3 Use a model to explain the relationships between the orientation of Earth's axis in relation to the Sun, Earth's motion, and seasonal patterns in the number of daylight hours.

SCI.EE.8.ESS.SolSys-4 Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

SCI.EE.12.ESS.SolSys-1 Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star's mass and distance from Earth.

SCI.EE.12.ESS.SolSys-2 Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth's surface and seasonal temperature patterns.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.5.ESS.SolSys-2 **Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.**

DLM Disciplinary Core Idea Family

Earth in the Solar System

- The Sun, a star, gives off light, transferring energy to Earth (see SCI.EE.5.ESS-SolSys-1).
- Earth’s axis is an imaginary line through Earth that Earth spins around (i.e., rotates).
- Earth spins or rotates upon an imaginary axis. This spin results in daytime and nighttime.
- The part of Earth facing the Sun experiences day or sunlight while the part of Earth facing away from the Sun experiences nighttime or darkness.
- The Earth completes one full spin upon its axis every 24 hours.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 3–5 builds on K–2 experiences and progresses to using models (e.g., diagram, drawing, physical replica, maps, diorama, dramatization, graphs, storyboard) that represent relationships and events.

- Use and compare models to represent amounts, relationships, and patterns in the natural world.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.
- Patterns can be used as evidence to support explanation.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- A system is a group of related parts that make up a whole and can carry out functions its individual parts cannot.
- A system can be described in terms of its components and their interactions.

Related NGSS Performance Expectations

5-ESS1-2 Represent data in graphical displays to reveal patterns of daily changes in length and direction of shadows, day and night, and the seasonal appearance of some stars in the night sky.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth's gravity exerts a downward force on all objects on its surface.

SCI.EE.8.ESS.SolSys-1 Use models to compare the components of our solar system and describe the motions of those components.

SCI.EE.8.ESS.SolSys-2 Use a model of the Sun-Earth-Moon system to explain the relationship between the motion of the Moon and the cyclical patterns of its phases.

SCI.EE.8.ESS.SolSys-3 Use a model to explain the relationships between the orientation of Earth's axis in relation to the Sun, Earth's motion, and seasonal patterns in the number of daylight hours.

SCI.EE.8.ESS.SolSys-4 Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

SCI.EE.12.ESS.SolSys-1 Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star's mass and distance from Earth.

SCI.EE.12.ESS.SolSys-2 Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth's surface and seasonal temperature patterns.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.5.ESS.SolSys-3

Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- The Earth completes one full rotation upon its axis every 24 hours (see SCI.EE.5.ESS-SolSys-2).
 - The part of Earth facing the Sun experiences daytime or sunlight while the part of Earth facing away from the Sun experiences nighttime or darkness.
- The number of daylight hours can vary throughout the year. This variation may result in seasonal patterns.
 - Examples of patterns in the Northern Hemisphere could include that the number of hours of daylight in summer months are generally greater than in winter months and the number of hours of daylight generally decreases from summer months to winter months.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 3–5 builds on K–2 experiences and progresses to using data and mathematical concepts to describe the natural and designed world.

- Use simple data tables and graphs to determine and describe relationships in the natural world.
- Use measurements and simple mathematical representations to describe characteristics of the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.
- Patterns can be used as evidence to support explanation.

Students who demonstrate understanding can:

SCI.EE.5.ESS.SolSys-4

Make observations to support that Earth’s gravity exerts a downward force on all objects on its surface.

DCI Family DLM Disciplinary Core Idea Family

Earth in the Solar System

- Some forces act through contact, while other forces act even when the objects are not in contact (see SCI.EE.5.PS.Forces-2).
- Gravity is the force that pulls all objects on Earth’s surface downward (i.e., towards the center of Earth).
- Gravity pulls both heavy and light objects downward.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in grades 3–5 builds on K–2 experiences and progresses to using tools and observations in investigations to record data and support claims.

- Collect and record data using tools to determine and support an explanation of a phenomenon.
- Use observations and measurements to determine and describe cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.
- Patterns can be used as evidence to support explanation.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Related NGSS Performance Expectations

3-PS2-1 Plan and conduct an investigation to provide evidence of the effects of balanced and unbalanced forces on the motion of an object.

5-PS2-1 Support an argument that the gravitational force exerted by Earth on objects is directed down.

3-PS2-2 Make observations and/or measurements of an object’s motion to provide evidence that a pattern can be used to predict future motion.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth’s gravity exerts a downward force on all objects on its surface.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.5.ESS.Earth-1 **Use a model to describe the distribution of fresh and salt water on Earth's surface.**

DLM Disciplinary Core Idea Family

Earth Systems

- Nearly all of Earth's available water is in the ocean, which is salt water.
- Drinkable water is fresh water, not salt water, and is found in streams, lakes, wetlands, and glaciers.
- There is a limited amount of fresh water on Earth. Most fresh water is in glaciers and only a tiny fraction is in streams, lakes, and wetlands.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 3–5 builds on K–2 experiences and progresses to using models (e.g., diagram, drawing, physical replica, maps, diorama, dramatization, graphs, storyboard) that represent relationships and events.

- Use and compare models to represent amounts, relationships, and patterns in the natural world.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 3–5 builds on K–2 experiences and progresses to using data and mathematical concepts to describe the natural and designed world.

- Use simple data tables and graphs to determine and describe relationships in the natural world.
- Use measurements and simple mathematical representations to describe characteristics of the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- Relative scales allow objects and events to be compared and described (e.g., bigger and smaller; hotter and colder; faster and slower).
- Standard units are used to measure length.
- Natural objects and/or observable phenomena exist from the very small to the immensely large or from very short to very long time periods.
- Standard units are used to measure and describe physical quantities such as weight, time, temperature, and volume.

Related NGSS Performance Expectations

5-ESS2-2 Describe and graph the amounts of salt water and fresh water in various reservoirs to provide evidence about the distribution of water on Earth.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth's surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth's surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth’s spheres can cause changes to other Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth’s systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.5.ESS.Earth-2

Use information to describe that water is found in different forms almost everywhere on Earth.

DLM Disciplinary Core Idea Family

Earth Systems

- Depending on temperature, water exists in different states: solid, liquid, or gas.
- Water is found almost everywhere on Earth.
 - It is found as water vapor (gas) in the air.
 - It is found in the clouds as tiny water droplets (liquid).
 - It is found in the sky and as rain (liquid), ice (solid), or snow (solid) falling from clouds.
 - It is found as ice, snow, and standing water on Earth's surface.
 - It is found in bodies of water on Earth's surface (e.g., lakes, streams, oceans).
 - It is found as running water on land.

DLM Science and Engineering Practices

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 3–5 builds on K–2 experiences and progresses to describing scientific ideas.

- Use observations, images, simple texts, and other media to understand problems and determine how the natural world works.
- Use information (e.g., observations, images, graphs, maps) to answer questions and support scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- Matter is made of particles.
- Matter flows and cycles can be tracked in terms of the weight of the substances before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.
- Energy can be transferred in various ways and between objects.

Related NGSS Performance Expectations

5-ESS2-1 Develop a model using an example to describe ways the geosphere, biosphere, hydrosphere, and/or atmosphere interact.

5-ESS2-2 Describe and graph the amounts of salt water and fresh water in various reservoirs to provide evidence about the distribution of water on Earth.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth's surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth's surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth’s spheres can cause changes to other Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

Students who demonstrate understanding can:

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

DLM Disciplinary Core Idea Family

Earth Systems

- Water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.
 - This includes weathering, erosion, and deposition.
 - Examples could include sand dunes, potholes, gullies and creeks, mudslides, and rivers carving out canyons.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in grades 3–5 builds on K–2 experiences and progresses to using tools and observations in investigations to record data and support claims.

- Collect and record data using tools to determine and support an explanation of a phenomenon.
- Use observations and measurements to determine and describe cause-and-effect relationships.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Change is measured in terms of differences over time and may occur at different rates.
- Some systems appear stable, but over long periods of time will eventually change.

Related NGSS Performance Expectations

4-ESS2-1 Make observations and/or measurements to provide evidence of the effects of weathering or the rate of erosion by water, ice, wind, or vegetation.

5-ESS2-1 Develop a model using an example to describe ways the geosphere, biosphere, hydrosphere, and/or atmosphere interact.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth’s surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth’s surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth's spheres can cause changes to other Earth's spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth's systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.5.ESS.Weath-1 **Determine patterns in weather data to help predict future weather.**

DLM Disciplinary Core Idea Family

Weather and Climate

- Weather is the daily local changes in atmosphere (e.g., wind, amount of sunlight, precipitation, and temperature.)
- Patterns in measurements or observations of weather conditions can be used to make and support predictions about future weather.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.
- Patterns can be used as evidence to support explanation.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Related NGSS Performance Expectations

3-ESS2-1 Represent data in tables and graphical displays to describe typical weather conditions expected during a particular season.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Weath-1 Use local weather condition data to describe patterns over time.

SCI.EE.5.ESS.Weath-1 Determine patterns in weather data to help predict future weather.

SCI.EE.8.ESS.Weath-1 Determine the weather data needed to describe patterns in the movement of air masses that likely cause changes in weather.

SCI.EE.8.ESS.Weath-2 Use information to describe the relationships between regional climates, locations on Earth, geographic features, and weather.

SCI.EE.12.ESS.Weath-1 Use data to determine the relationship between the absorption of the Sun’s energy by Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere) and trends in average global temperature.

SCI.EE.12.ESS.Weath-2 Ask questions to describe the relationship between human activity and global average temperature.

Students who demonstrate understanding can:

SCI.EE.5.ESS.Impact-1 **Explain how a design solution reduces the impacts of severe weather on humans.**

DLM Disciplinary Core Idea Family

Reducing Impacts of Severe Weather

- Natural hazards (e.g., floods, tornadoes, blizzards, mudslides) cannot be stopped, but humans can take steps to reduce their impacts.
- A variety of harmful impacts result from severe weather (see SCI.EE.5.ESS-Weath-1).
 - Examples of harmful impacts could include unpassable roads, building damage, and restricted power and communication systems.
- A situation that people want to change or create can be approached as a problem to be solved through engineering.
- Before understanding how a solution works, it is important to clearly understand the problem to be solved.
- Asking questions, making observations, and gathering information help to understand problems.
- Examples of solutions could include lightning rods, wind-resistant roofs, advanced warning systems, and community emergency plans.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 3–5 builds on K–2 experiences and progresses to identifying questions to gain information through investigation.

- Develop questions that can help determine cause-and-effect relationships.
- Ask questions about how a simple design solution is used.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.
- Use information to determine and explain cause-and-effect relationships in the designed world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Change is measured in terms of differences over time and may occur at different rates.
- Some systems appear stable, but over long periods of time will eventually change.

Related NGSS Performance Expectations

3-ESS3-1 Make a claim about the merit of a design solution that reduces the impacts of a weather-related hazard.

4-ESS2-1 Make observations and/or measurements to provide evidence of the effects of weathering or the rate of erosion by water, ice, wind, or vegetation.

4-ESS3-2 Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans.

5-ESS3-1 Obtain and combine information about ways individual communities use science ideas to protect the Earth's resources and environment.

3-5-ETS1-1 Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time, or cost.

3-5-ETS1-2 Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Impact-1 Use information to identify the impacts of severe weather on humans.

SCI.EE.5.ESS.Impact-1 Explain how a design solution reduces the impacts of severe weather on humans.

SCI.EE.8.ESS.Impact-1 Evaluate solutions that reduce the impacts of severe weather on humans.

SCI.EE.12.ESS.Impact-1 Improve a solution that reduces the impacts of severe weather on humans.

Students who demonstrate understanding can:

SCI.EE.5.PS.Matter-1

Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Observations and measurements of a variety of properties can be used to describe physical changes in matter.
 - Measurements could include mass (weight), size (length, width, height), temperature, or volume.
 - Observations could include color, texture, state of matter, etc.
- A phase change is a physical process in which a substance goes from one phase or state to another.
 - Usually, the change occurs when adding or removing heat. The nature of the phase change depends on the direction of the heat transfer.
 - Heat going into a substance changes it from a solid to a liquid or a liquid to a gas.
 - Removing heat from a substance changes a gas to a liquid or a liquid to a solid.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in grades 3–5 builds on K–2 experiences and progresses to using tools and observations in investigations to record data and support claims.

- Collect and record data using tools to determine and support an explanation of a phenomenon.
- Use observations and measurements to determine and describe cause-and-effect relationships.

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is made of particles.
- Matter flows and cycles can be tracked in terms of the weight of the substances before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.
- Energy can be transferred in various ways and between objects.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Change is measured in terms of differences over time and may occur at different rates.
- Some systems appear stable, but over long periods of time will eventually change.

Related NGSS Performance Expectations

5-PS1-3 Make observations and measurements to identify materials based on their properties.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Matter-1 Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.

SCI.EE.5.PS.Matter-1 Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

SCI.EE.5.PS.Matter-2 Use evidence to support a claim that matter exists even when it cannot be seen.

SCI.EE.8.PS.Matter-1 Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.

SCI.EE.8.PS.Matter-2 Gather and use data to support the law of conservation of mass when substances change.

SCI.EE.8.PS.Matter-3 Gather and use data to determine whether an interaction between substances results in the formation of a new substance.

SCI.EE.12.PS.Matter-1 Use a model to describe that substances are made of different types and numbers of atoms.

SCI.EE.12.PS.Matter-2 Use a model to describe that in chemical reactions, the atoms in the starting substances (i.e., the reactants) rearrange to form new substances (i.e., the products).

SCI.EE.12.PS.Matter-3 Based on data, describe how the temperature and amount (i.e., concentration) of reacting substances affect the rates of chemical reactions.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.5.PS.Matter-2

Use evidence to support a claim that matter exists even when it cannot be seen.

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Matter is anything (i.e., substances) that has mass or weight and takes up space in all three states (i.e., solids, liquids, gases).
- Matter or substances exist as particles that are too small to see and can be detected by other means.
 - Observations and measurements of a variety of properties can be used as evidence that matter is made of particles too small to be seen (e.g., syringe not being compressible, tire or balloon inflating or deflating, bubbles, mass of liquid in a closed system before and after evaporation).
- Matter is always conserved (i.e., it is always present even when you can't see it).
 - Matter is conserved even if it seems to disappear.
 - Matter is conserved when matter changes state, phase, or form.
 - Matter is conserved when mixed or combined, heated or cooled.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- Matter is made of particles.
- Matter flows and cycles can be tracked in terms of the weight of the substances before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.
- Energy can be transferred in various ways and between objects.

Related NGSS Performance Expectations

5-PS1-1 Develop a model to describe that matter is made of particles too small to be seen.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Matter-1 Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.

SCI.EE.5.PS.Matter-1 Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

SCI.EE.5.PS.Matter-2 Use evidence to support a claim that matter exists even when it cannot be seen.

SCI.EE.8.PS.Matter-1 Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.

SCI.EE.8.PS.Matter-2 Gather and use data to support the law of conservation of mass when substances change.

SCI.EE.8.PS.Matter-3 Gather and use data to determine whether an interaction between substances results in the formation of a new substance.

SCI.EE.12.PS.Matter-1 Use a model to describe that substances are made of different types and numbers of atoms.

SCI.EE.12.PS.Matter-2 Use a model to describe that in chemical reactions, the atoms in the starting substances (i.e., the reactants) rearrange to form new substances (i.e., the products).

SCI.EE.12.PS.Matter-3 Based on data, describe how the temperature and amount (i.e., concentration) of reacting substances affect the rates of chemical reactions.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.5.PS.Forces-1

Make observations to determine the effects of balanced and unbalanced forces on the motion (i.e., speed and direction) of an object.

DLM Disciplinary Core Idea Family

Interacting Forces

- Each force acts on one particular object and has both strength and direction.
- Objects in contact exert forces on each other. One object applies a force on the other and vice versa (i.e., they push on each other).
- A change in the forces acting on an object can cause changes in the motion of that object.
- An object typically has multiple forces acting on it. The motion of an object depends on the total forces acting on that object.
 - When the multiple forces acting on an object balance each other out (i.e., balanced forces have zero net force on the object), there is no change in that object's motion.
 - An object at rest has balanced forces acting on it.
 - An object moving at a constant speed has balanced forces acting on it.
 - Forces acting on an object that are not balanced (i.e., do not sum to zero) can change the object's motion (i.e., speed it up, slow it down, stop it, and change direction).

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in grades 3–5 builds on K–2 experiences and progresses to using tools and observations in investigations to record data and support claims.

- Collect and record data using tools to determine and support an explanation of a phenomenon.
- Use observations and measurements to determine and describe cause-and-effect relationships.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 3–5 builds on K–2 experiences and progresses to using data and mathematical concepts to describe the natural and designed world.

- Use simple data tables and graphs to determine and describe relationships in the natural world.
- Use measurements and simple mathematical representations to describe characteristics of the natural world.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 3–5 builds on K–2 experiences and progresses to describing and explaining processes or relationships in the natural or designed world.

- Identify observations, information, data, or models to describe and explain processes or relationships in the natural world.
- Use information to determine and explain cause-and-effect relationships in the designed world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.
- Patterns can be used as evidence to support explanation.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- Natural objects and/or observable phenomena exist from the very small to the immensely large or from very short to very long time periods.
- Standard units are used to measure and describe physical quantities such as weight, time, temperature, and volume.

Related NGSS Performance Expectations

3-PS2-1 Plan and conduct an investigation to provide evidence of the effects of balanced and unbalanced forces on the motion of an object.

3-PS2-2 Make observations and/or measurements of an object’s motion to provide evidence that a pattern can be used to predict future motion.

4-PS3-3 Ask questions and predict outcomes about the changes in energy that occur when objects collide.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Forces-1 Make observations to compare the effects of different strengths and directions of pushes and pulls on the motion of an object.

SCI.EE.5.PS.Forces-1 Make observations to determine the effects of balanced and unbalanced forces on the motion (i.e., speed and direction) of an object.

SCI.EE.5.PS.Forces-2 Provide evidence that some objects (e.g., magnets, metals, pith balls, objects falling toward Earth) exert forces on each other even when the objects are not in contact.

SCI.EE.8.PS.Forces-1 Use observations and measurements to determine how an object’s mass affects the force needed to change its motion.

SCI.EE.8.PS.Forces-2 Make observations of the motion of two colliding objects to provide evidence of Newton’s third law.

SCI.EE.12.PS.Forces-1 Conduct an investigation to describe the relationships between force, mass, and acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.5.PS.Forces-2

Provide evidence that some objects (e.g., magnets, metals, pith balls, objects falling toward Earth) exert forces on each other even when the objects are not in contact.

DLM Disciplinary Core Idea Family

Interacting Forces

- Attraction and repulsion (i.e., motion towards or away from) between objects are evidence of forces between objects that are not in contact.
- The gravitational force of Earth acting on an object near Earth's surface pulls that object toward the planet's center (i.e., down towards Earth's surface).
- Electric and magnetic forces can act on objects that are not in contact.
 - The magnitudes (or sizes) of the forces acting on objects depend on the distances apart and on their orientation relative to each other.
 - Electric forces include static electricity.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 3–5 builds on K–2 experiences and progresses to using and interpreting data to support claims and relationships.

- Represent and interpret data in tables or graphs to determine and identify patterns that indicate relationships.
- Use data as evidence for constructing and supporting claims about cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Similarities and differences in patterns can be used to sort, classify, communicate, and analyze simple rates of change for natural phenomena and designed products.
- Patterns of change can be used to make predictions.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Cause and effect relationships are routinely identified, tested, and used to explain change.
- Events that occur together with regularity might or might not be a cause and effect relationship.

Related NGSS Performance Expectations

3-PS2-3 Ask questions to determine cause and effect relationships of electric or magnetic interactions between two objects not in contact with each other.

3-PS2-4 Define a simple design problem that can be solved by applying scientific ideas about magnets.

5-PS2-1 Support an argument that the gravitational force exerted by Earth on objects is directed down.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Forces-1 Make observations to compare the effects of different strengths and directions of pushes and pulls on the motion of an object.

SCI.EE.5.PS.Forces-1 Make observations to determine the effects of balanced and unbalanced forces on the motion (i.e., speed and direction) of an object.

SCI.EE.5.PS.Forces-2 Provide evidence that some objects (e.g., magnets, metals, pith balls, objects falling toward Earth) exert forces on each other even when the objects are not in contact.

SCI.EE.8.PS.Forces-1 Use observations and measurements to determine how an object's mass affects the force needed to change its motion.

SCI.EE.8.PS.Forces-2 Make observations of the motion of two colliding objects to provide evidence of Newton's third law.

SCI.EE.12.PS.Forces-1 Conduct an investigation to describe the relationships between force, mass, and acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.5.PS.Energy-1

Use observations to support a claim about the amount of energy moved from one place to another by sound, light, heat, and moving objects.

DLM Disciplinary Core Idea Family

Energy

- Energy is the ability to do work. It is how things change, grow, and move. It's everywhere around us and takes all sorts of forms.
- Moving objects, sound, light, or heat move energy from one place to another. The amount of energy moved (or transferred) can be inferred from the degree to which sound can be heard, light can be seen, heat can be felt, and an object moves.
- The faster a given object moves, the more energy it possesses. The slower the object, the less energy it possesses.
- Sound can make matter vibrate, and vibrating matter can make sound.
 - The louder a sound, the more energy it possesses.
 - The softer a sound, the less energy it possesses.
- Light travels from its source to another location in a straight path.
 - The brighter (or more intense) a light, the more energy it possesses.
 - The dimmer (or less intense) a light, the less energy it possesses.
- Heat is a form of energy.
 - Heat flows from warmer objects to cooler objects.
 - When something is hot, it has a lot of heat energy; when it is cold, it has less.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations to answer questions or test solutions to problems in grades 3–5 builds on K–2 experiences and progresses to using tools and observations in investigations to record data and support claims.

- Collect and record data using tools to determine and support an explanation of a phenomenon.
- Use observations and measurements to determine and describe cause-and-effect relationships.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 3–5 builds on K–2 experiences and progresses to identifying information that can support claims about the natural world.

- Identify relevant evidence to support a claim.
- Use observations, information, data, or a model to support cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- Matter is made of particles.
- Matter flows and cycles can be tracked in terms of the weight of the substances before and after a process occurs. The total weight of the substances does not change. This is what is meant by conservation of matter. Matter is transported into, out of, and within systems.
- Energy can be transferred in various ways and between objects.

Related NGSS Performance Expectations

4-PS3-1 Use evidence to construct an explanation relating the speed of an object to the energy of that object.

4-PS3-2 Make observations to provide evidence that energy can be transferred from place to place by sound, light, heat, and electric currents.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Energy-1 Make observations that energy exists.

SCI.EE.5.PS.Energy-1 Use observations to support a claim about the amount of energy moved from one place to another by sound, light, heat, and moving objects.

SCI.EE.8.PS.Energy-1 Develop a model to infer the relationship between the kinetic energy and temperature of an object or particles of a substance.

SCI.EE.8.PS.Energy-2 Provide evidence that kinetic energy is transferred between two objects when they collide with each other.

SCI.EE.8.PS.Energy-3 Develop a model to describe the behavior of light (i.e., transmission, reflection, scattering) that comes into contact with objects made of different materials.

SCI.EE.12.PS.Energy-1 Gather data to describe the thermal energy transfer between two objects or substances in contact with each other.

SCI.EE.12.PS.Energy-2 Ask questions to describe the relationship between sound energy and the vibrations of particles of matter.

Students who demonstrate understanding can:

SCI.EE.8.LS.Org-1

Provide evidence that living things are made of cells, some of which are unicellular while others are multicellular.

DLM Disciplinary Core Idea Family

Organisms: Structure and Function, Growth, and Development

- Living things are made of cells.
 - Cells are the smallest unit of life.
 - Most cells have a nucleus and a membrane.
 - Nuclei contain hereditary materials and control the cells.
 - Membranes protect the cell and control materials moving into and out of the cell.
- There are unicellular and multicellular living things.
 - Multicellular organisms are made of multiple cells, and possibly different types of cells.
 - The cell of a unicellular organism handles all the organism’s functions.
 - The cells of a multicellular organism work together to support all the organism’s functions.

DLM Science and Engineering Practices

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 6–8 builds on K–5 experiences and progresses to use information to make and evaluate claims about the natural world.

- Use observations, information, data, or a model to evaluate a claim.
- Gather and use information as evidence to support a claim.
- Use information to make cause-and-effect claims.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 6–8 builds on K–5 experiences and progresses to combining information to describe and support scientific claims and ideas.

- Decide which observations, images, texts, data, and other media are useful for defining problems and determining how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to answer scientific questions and evaluate scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- Complex and microscopic structures and systems can be visualized, modeled, and used to describe how their function depends on the shapes, composition, and relationships among its parts; therefore, complex natural and designed structures/systems can be analyzed to determine how they function.
- Structures can be designed to serve particular functions by taking into account properties of different materials, and how materials can be shaped and used.

Related NGSS Performance Expectations

MS-LS1-1 Conduct an investigation to provide evidence that living things are made of cells; either one cell or many different numbers and types of cells.

MS-LS1-2 Develop and use a model to describe the function of a cell as a whole and ways the parts of cells contribute to the function.

MS-LS1-3 Use argument supported by evidence for how the body is a system of interacting subsystems composed of groups of cells.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Org-1 Use information to identify that different organisms have different external parts for specific functions.

SCI.EE.5.LS.Org-1 Use information to describe how the parts of organisms help them survive, grow, and reproduce.

SCI.EE.8.LS.Org-1 Provide evidence that living things are made of cells, some of which are unicellular while others are multicellular.

SCI.EE.12.LS.Org-1 Use a model to construct an explanation of how systems of specialized cells within organisms work together to perform essential functions of life.

Students who demonstrate understanding can:

SCI.EE.8.LS.Plant-1

Use data to explain that plants use energy (i.e., sunlight) and matter (i.e., air and water) to produce food (i.e., plant matter) for growth.

DLM Disciplinary Core Idea Family

Plants: Cycling of Matter and Flow of Energy

- Plants use light energy (i.e., Sun) and matter (i.e., air and water) from the environment to produce food.
- The food produced by plants is used for growth, for energy, or is stored for later use.
- The apparent increase in plant matter or material (e.g., increase in mass, height of stalk, number of leaves) is evidence of the transfer of matter from the environment to the plant.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g. energy in fields, thermal energy, energy of motion).
- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-LS1-6 Construct a scientific explanation based on evidence for the role of photosynthesis in the cycling of matter and flow of energy into and out of organisms.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Plant-1 Investigate what plants need to grow.

SCI.EE.5.LS.Plant-1 Use data to show that plants use energy (i.e., sunlight) and matter (i.e., air and water) for growth.

SCI.EE.8.LS.Plant-1 Use data to explain that plants use energy (i.e., sunlight) and matter (i.e., air and water) to produce food (i.e., plant matter) for growth.

SCI.EE.12.LS.Plant-1 Use a model to explain the role of plants in the flow of energy and matter among organisms in the ecosystem.

Students who demonstrate understanding can:

SCI.EE.8.LS.Ecosys-1

Use a model to describe the transfer of food (i.e., matter and energy) between plants, animals, and decomposers.

DLM Disciplinary Core Idea Family

Ecosystem: Cycling of Matter and Flow of Energy

- Energy (i.e., sunlight) is required for plants to produce food (i.e., plant matter). Therefore, the energy released from food was once energy from the Sun that was captured by plants in the process that forms plant matter (from air and water) (see SCI.EE.8.LS.Plant-1).
- The food produced by plants is used for growth, for energy, or is stored for later use.
- Some animals eat plants; some animals eat both plants and animals; some animals eat only animals.
- Organisms are interconnected in food webs. Food webs model how matter and energy are transferred among producers, consumers, and decomposers.
- Decomposers break down dead plants and animals, recycling nutrients to the soil.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g., energy in fields, thermal energy, energy of motion).
- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-LS2-3 Develop a model to describe the cycling of matter and flow of energy among living and nonliving parts of an ecosystem.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Ecosys-1 Use information to support that animals need food to live and grow.

SCI.EE.5.LS.Ecosys-1 Use data to support that food provides animals with the materials and energy they need for body repair, growth, warmth, and motion.

SCI.EE.8.LS.Ecosys-1 Use a model to describe the transfer of food (i.e., matter and energy) between plants, animals, and decomposers.

SCI.EE.12.LS.Ecosys-1 Develop a model that describes how matter (plant or animal matter) and energy (i.e., sunlight and food energy) are cycled within an ecosystem.

Students who demonstrate understanding can:

SCI.EE.8.LS.EcoHlth-1

Use data to explain the relationship between organisms' survival and growth and their interactions with both living and nonliving factors in their ecosystem.

DLM Disciplinary Core Idea Family

Ecosystem Health

- Organisms, including humans, depend on their habitat (biosphere, hydrosphere, atmosphere, and geosphere) for many living and nonliving resources. These resources are not evenly distributed.
- The survival of organisms is dependent upon their interactions with both other living things (biosphere) and nonliving factors (geosphere, hydrosphere, and atmosphere).
 - Interactions could include predation, competition, disease, immigration of species, cooperation or symbiosis, drought, flood, food availability, nesting and sheltering, etc.
- Limiting factors slow or stop population growth. Examples include predation, competition, disease, immigration of species, weather, food, and water availability.
 - Limiting factors affect populations' access to living and nonliving resources.
- Ecosystems can change over time.
- Living organisms (biosphere) have impacted Earth's spheres (hydrosphere, geosphere, and atmosphere).
 - Human activity can disrupt or improve ecosystems.
 - Focus is on the interactions or impacts and not on identifying or naming spheres.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Explanations of stability and change in natural or designed systems can be constructed by examining the changes over time and forces at different scales, including the atomic scale.

- Small changes in one part of a system might cause large changes in another part.
- Stability might be disturbed either by sudden events or gradual changes that accumulate over time.
- Systems in dynamic equilibrium are stable due to a balance of feedback mechanisms.

Related NGSS Performance Expectations

MS-LS2-2 Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.

MS-LS2-3 Develop a model to describe the cycling of matter and flow of energy among living and nonliving parts of an ecosystem.

MS-LS2-4 Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations.

MS-LS2-5 Evaluate competing design solutions for maintaining biodiversity and ecosystem services.

MS-LS2-1 Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.EcoHlth-1 Use information to describe that many kinds of living things live in different habitats.

SCI.EE.5.LS.EcoHlth-1 Use information to support that healthy ecosystems meet the needs of many varieties and types of organisms.

SCI.EE.5.LS.EcoHlth-2 Ask questions to determine how living things (both plants and animals) impact the habitat in which they live.

SCI.EE.8.LS.EcoHlth-1 Use data to explain the relationship between organisms' survival and growth and their interactions with both living and nonliving factors in their ecosystem.

SCI.EE.12.LS.EcoHlth-1 Use data to make an argument about the effects of unstable environments on the health of ecosystems.

Students who demonstrate understanding can:

SCI.EE.8.LS.Group-1

Use information to explain the relationship between animals' abilities to sense and communicate information and the response behaviors that help them grow and survive.

DLM Disciplinary Core Idea Family

Group Survival Behavior

- Animals sense and communicate information and respond with behaviors that help them grow and survive.
- Sense receptors capture different types of information that is processed by the brain to guide behavior.
- Sound transmits through a medium (e.g., air, land) via vibrations, which are detected by the ears and through touch.
- Light travels through space and when shined on a nonluminous object, it is reflected. The object can be seen when the reflected light enters the eyes (see 8.PS.Energy-3).
- Luminous objects can be seen when their light enters the eyes.
- Emphasis is on behavior leading to individual survival, not population survival.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- Complex and microscopic structures and systems can be visualized, modeled, and used to describe how their function depends on the shapes, composition, and relationships among its parts; therefore, complex natural and designed structures/systems can be analyzed to determine how they function.
- Structures can be designed to serve particular functions by taking into account properties of different materials, and how materials can be shaped and used.

Related NGSS Performance Expectations

MS-LS1-4 Use argument based on empirical evidence and scientific reasoning to support an explanation for how characteristic animal behaviors and specialized plant structures affect the probability of successful reproduction of animals and plants respectively.

MS-LS1-8 Gather and synthesize information that sensory receptors respond to stimuli by sending messages to the brain for immediate behavior or storage as memories.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Group-1 Use information to identify that offspring learn survival behaviors.

SCI.EE.5.LS.Group-1 Provide evidence that animals gain information for survival through their senses.

SCI.EE.8.LS.Group-1 Use information to explain the relationship between animals' abilities to sense and communicate information and the response behaviors that help them grow and survive.

SCI.EE.12.LS.Group-1 Use data to support a claim about how group behavior affects individuals' and species' chances to survive.

Students who demonstrate understanding can:

SCI.EE.8.LS.Trait-1

Use information to determine how the environment affects organisms' traits and their survival.

DLM Disciplinary Core Idea Family

Traits of Organisms

- Particular organisms can survive only in particular environments.
- Species can change over time in response to changes in environmental conditions through adaptation by natural selection acting over generations.
 - Characteristics of individuals result from interactions with their environments. These interactions are diverse and can include diet based on food availability, behaviors learned within a community, roots growing longer and deeper to reach the water table during drought, outer layer (e.g., skin, fur, bark) becoming thicker due to varying climate, etc.
 - The environment also affects the traits that a population develops; differences in where they grow or in the food they consume may cause organisms that are related (i.e., the population) to end up looking or behaving differently.
 - Certain traits help with or increase the chance of survival and are passed down from parents to offspring, becoming more common over time (see 8.LS.Org-1). Traits that do not help with or increase the chance of survival are not passed down to offspring, becoming less common over time.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 6–8 builds on K–5 experiences and progresses to developing and using questions to clarify information and define problems.

- Classify and compare information that answers questions about how the natural world works.
- Develop questions that can be answered by an investigation.
- Ask questions that help to define a simple design problem.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 6–8 builds on K–5 experiences and progresses to combining information to describe and support scientific claims and ideas.

- Decide which observations, images, texts, data, and other media are useful for defining problems and determining how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to answer scientific questions and evaluate scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.

- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Explanations of stability and change in natural or designed systems can be constructed by examining the changes over time and forces at different scales, including the atomic scale.
- Small changes in one part of a system might cause large changes in another part.
- Stability might be disturbed either by sudden events or gradual changes that accumulate over time.
- Systems in dynamic equilibrium are stable due to a balance of feedback mechanisms.

MS-LS2-1 Analyze and interpret data to provide evidence for the effects of resource availability on organisms and populations of organisms in an ecosystem.

MS-LS2-2 Construct an explanation that predicts patterns of interactions among organisms across multiple ecosystems.

MS-LS2-4 Construct an argument supported by empirical evidence that changes to physical or biological components of an ecosystem affect populations.

MS-LS4-4 Construct an explanation based on evidence that describes how genetic variations of traits in a population increase some individuals' probability of surviving and reproducing in a specific environment.

MS-LS4-6 Use mathematical representations to support explanations of how natural selection may lead to increases and decreases of specific traits in populations over time.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Trait-1 Use information to show that organisms (both plants and animals) may resemble their biological parents but are not identical to their parents.

SCI.EE.5.LS.Trait-1 Use information to describe that different organisms vary in how they look due to the traits passed down from their parents.

SCI.EE.8.LS.Trait-1 Use information to determine how the environment affects organisms' traits and their survival.

SCI.EE.12.LS.Trait-1 Use information to support a claim that heredity and the environment influence the traits of an individual.

SCI.EE.12.LS.Trait-2 Use mathematical reasoning to support relationships between changing environmental conditions, adaptation by natural selection, and changes in the distribution of traits within a population.

Students who demonstrate understanding can:

SCI.EE.8.LS.Human-1

Define problems caused by human activities on ecosystems.

DLM Disciplinary Core Idea Family

Human Impacts on Ecosystems

- Human activity can disrupt ecosystems.
- Organisms, including humans, depend on their habitat (biosphere, hydrosphere, atmosphere, and geosphere) for many living and non-living resources. These resources are not evenly distributed.
 - Humans' use of energy and fuels comes from natural sources.
- Organisms are dependent on their interactions with both other living things (biosphere) and nonliving factors (geosphere, hydrosphere, and atmosphere).
 - Interactions could include predation, competition, disease, immigration of species, cooperation or symbiosis, weather, food availability, nesting, and sheltering, etc.
- Limiting factors slow or stop population growth. Examples include predation, competition, disease, immigration of species, weather, food, and water availability.
- Unstable environments experience changes that impact populations, such as floods, drought, disease, too many predators, or immigration of other species.
 - Unstable environments can decrease biodiversity.
 - Changes in biodiversity affect populations' access to living and nonliving resources. This includes humans.
- Living organisms (biosphere) have impacted Earth's spheres (hydrosphere, geosphere, and atmosphere).
 - Focus is on the interactions or impacts and not on identifying or naming spheres.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 6–8 builds on K–5 experiences and progresses to developing and using questions to clarify information and define problems.

Students who demonstrate understanding can:

SCI.EE.8.ESS.SolSys-1

Use models to compare the components of our solar system and describe the motions of those components.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- Our solar system is within the Milky Way galaxy, which is one of many galaxies.
- A galaxy is a group of stars that we see in the night sky.
- The Sun is one of many stars in the galaxy.
- Earth, as well as other planets, rotate upon (or spin around) an axis as they orbit the Sun.
- The time it takes a planet to complete a full rotation upon its axis is the length of a day. Earth takes 24 hours to complete a full rotation.
- A moon orbits (or revolves around) a planet. It takes about a month for the Moon to orbit Earth.
- Earth and the other planets orbit the Sun. It takes a year or about 365 days for the Earth to orbit the Sun.
- The distances of the planets from the Sun vary. Earth is the third closest to the Sun.
- The apparent motion of the Sun in the sky can be explained by Earth’s motion.
- The East-West pattern of sunrise and sunset can be observed, described, and predicted with modeling the rotation of Earth relative to the Sun.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 6–8 builds on K–5 experiences and progresses to developing and using questions to clarify information and define problems.

- Classify and compare information that answers questions about how the natural world works.
- Develop questions that can be answered by an investigation.
- Ask questions that help to define a simple design problem.

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 6–8 builds on K–5 experiences and progresses to using and applying data and mathematical concepts to understand cause-and-effect relationships in the natural and designed world.

- Apply mathematical concepts and processes to determine and describe cause-and-effect relationships between variables.
- Use mathematical representations and reasoning to compare characteristics of components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- Time, space, and energy phenomena can be observed at various scales using models to study systems that are too large or too small.
- The observed function of natural and designed systems may change with scale.
- Proportional relationships (e.g., speed as the ratio of distance traveled to time taken) among different types of quantities provide information about the magnitude of properties and processes.
- Scientific relationships can be represented through the use of algebraic expressions and equations.
- Phenomena that can be observed at one scale may not be observable at another scale.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Students who demonstrate understanding can:

SCI.EE.8.ESS.SolSys-2

Use a model of the Sun-Earth-Moon system to explain the relationships between the motion of the Moon and the cyclical patterns of its phases.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- Earth rotates upon (or spins around) an axis as it orbits the Sun.
- The parts of Earth experiencing night are turned away from the Sun.
- Earth takes 24 hours to complete a full rotation.
- The cyclical patterns of the Moon's phases can be modeled by the Sun-Earth-Moon system.
- Light transfers energy from one place (i.e., the Sun) to another (i.e., the Moon and Earth) (see 8.PS.Energy-3).
 - The Moon does not produce light.
 - The Moon's light we see is the Sun's light reflected off the Moon's surface. Thus, light energy spontaneously transfers from the Sun to the Moon, and then to Earth.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

System and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Related NGSS Performance Expectations

MS-ESS1-1 Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.

MS-ESS1-3 Analyze and interpret data to determine scale properties of objects in the solar system.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth's rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth's gravity exerts a downward force on all objects on its surface.

SCI.EE.8.ESS.SolSys-1 Use models to compare the components of our solar system and describe the motions of those components.

SCI.EE.8.ESS.SolSys-2 Use a model of the Sun-Earth-Moon system to explain the relationship between the motion of the Moon and the cyclical patterns of its phases.

SCI.EE.8.ESS.SolSys-3 Use a model to explain the relationships between the orientation of Earth's axis in relation to the Sun, Earth's motion, and seasonal patterns in the number of daylight hours.

SCI.EE.8.ESS.SolSys-4 Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

SCI.EE.12.ESS.SolSys-1 Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star's mass and distance from Earth.

SCI.EE.12.ESS.SolSys-2 Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth's surface and seasonal temperature patterns.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.8.ESS.SolSys-4

Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- Gravitational forces are always attractive.
- Gravity is the force that holds together the solar system and controls orbital motions within it.
- Gravity exists between all objects, everywhere in the universe.
- Every celestial body in the universe attracts every other celestial body.
- The planets within our solar system are held in orbit around the Sun by its gravitational pull on them.
- Moons are held in orbit around their planets by their gravitational pull on the moons.

DLM Science and Engineering Practices

Developing and Using a Model: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Related NGSS Performance Expectations

MS-PS2-4 Construct and present arguments using evidence to support the claim that gravitational interactions are attractive and depend on the masses of interacting objects.

MS-ESS1-2 Develop and use a model to describe the role of gravity in the motions within galaxies and the solar system.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth’s gravity exerts a downward force on all objects on its surface.

SCI.EE.8.ESS.SolSys-1 Use models to compare the components of our solar system and describe the motions of those components.

SCI.EE.8.ESS.SolSys-2 Use a model of the Sun-Earth-Moon system to explain the relationship between the motion of the Moon and the cyclical patterns of its phases.

SCI.EE.8.ESS.SolSys-3 Use a model to explain the relationships between the orientation of Earth’s axis in relation to the Sun, Earth’s motion, and seasonal patterns in the number of daylight hours.

SCI.EE.8.ESS.SolSys-4 Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

SCI.EE.12.ESS.SolSys-1 Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star’s mass and distance from Earth.

SCI.EE.12.ESS.SolSys-2 Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth’s surface and seasonal temperature patterns.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.8.ESS.Earth-1

Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

DLM Disciplinary Core Idea Family

Earth Systems

- Water cycles among land, bodies of water (e.g., ocean, lakes, rivers, streams) and the atmosphere (or air).
 - Matter is neither created nor destroyed (see SCI.EE.8.PS-Matter-2). Therefore, the same water particles continually cycle between the atmosphere (i.e., air) and Earth’s surface.
- The processes that cycle water include evaporation, condensation, precipitation, and gravity pulling water downhill.
 - During evaporation, liquid water particles absorb the Sun’s energy and change to gas (i.e., water vapor) (see SCI.EE.8.PS-Energy-1 and SCI.EE.8.PS-Energy-2).
 - During condensation, gaseous water particles in the air lose energy or cool and change to liquid, forming clouds.
 - During precipitation, liquid and solid water particles fall from clouds to Earth’s surface.
- Depending on temperature, water particles exist in different states: solid, liquid, or gas.
- The kinetic energy of water particles in vapor is greater than in liquid, which is greater than in solid (see SCI.EE.8.PS-Matter-1).

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

System and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g. energy in fields, thermal energy, energy of motion).

- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-ESS2-4 Develop a model to describe the cycling of water through Earth’s systems driven by energy from the sun and the force of gravity.

MS-PS3-5 Construct, use, and present arguments to support the claim that when the kinetic energy of an object changes, energy is transferred to or from the object.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth’s surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth’s surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth’s spheres can cause changes to other Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth’s systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.8.ESS.Earth-2

Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

DLM Disciplinary Core Idea Family

Earth Systems

- The geosphere refers to such Earth features and components as rocks, minerals, landforms, etc.
- The hydrosphere refers to all water on Earth’s surface. This includes water that is part of the general water cycle (e.g., clouds, rain) (see SCI.EE.8.ESS-Earth-1).
- Gravity directs the flow of water (including glaciers) downhill.
 - Moving water carries soil and rocks from one place to another.
 - Over time, this affects the shape of land.
- The force of precipitation (i.e., rain, sleet, hail) can also affect the shape of land over time (see SCI.EE.8.ESS-Earth-1 and SCI.EE.5.PS-Forces-2).

DLM Science and Engineering Practices

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 6–8 builds on K–5 experiences and progresses to use information to make and evaluate claims about the natural world.

- Use observations, information, data, or a model to evaluate a claim.
- Gather and use information as evidence to support a claim.
- Use information to make cause-and-effect claims.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 6–8 builds on K–5 experiences and progresses to combining information to describe and support scientific claims and ideas.

- Decide which observations, images, texts, data, and other media are useful for defining problems and determining how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to answer scientific questions and evaluate scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Explanations of stability and change in natural or designed systems can be constructed by examining the changes over time and forces at different scales, including the atomic scale.
- Small changes in one part of a system might cause large changes in another part.
- Stability might be disturbed either by sudden events or gradual changes that accumulate over time.
- Systems in dynamic equilibrium are stable due to a balance of feedback mechanisms.

Related NGSS Performance Expectations

MS-ESS2-2 Construct an explanation based on evidence for how geoscience processes have changed Earth’s surface at varying time and spatial scales.

MS-ESS2-4 Develop a model to describe the cycling of water through Earth’s systems driven by energy from the sun and the force of gravity.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth's surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth's surface.

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth's systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.8.ESS.Weath-1

Determine the weather data needed to describe patterns in the movement of air masses that likely cause changes in weather.

DLM Disciplinary Core Idea Family

Weather and Climate

- Weather is affected by the Sun’s heat, movement of water in the atmosphere, and Interactions between moving air masses.
- Weather is defined by temperature, humidity (i.e., water vapor in the air), precipitation, and wind.
- Air masses are large bodies of air that have roughly the same temperature and humidity throughout.
- Air masses take on the weather characteristics of where they were formed (arctic, tropical, polar, and equatorial).
 - Air masses that form over the poles tend to be cold.
 - Air masses that form near the equator tend to be warm.
 - Air masses that form over water tend to be wet.
 - Air masses that form over land tend to be dry.
- Air masses move around in the atmosphere due to winds. When winds move air masses, the air masses carry their weather conditions (hot or cold, dry or moist) from the source region to a new region. This can lead to major changes in the weather.
 - For example, colder weather occurs when a cold air mass pushes a warm air mass out of the way.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 6–8 builds on K–5 experiences and progresses to developing and using questions to clarify information and define problems.

- Classify and compare information that answers questions about how the natural world works.
- Develop questions that can be answered by an investigation.
- Ask questions that help to define a simple design problem.

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 6–8 builds on K–5 experiences and progresses to combining information to describe and support scientific claims and ideas.

- Decide which observations, images, texts, data, and other media are useful for defining problems and determining how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to answer scientific questions and evaluate scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.

- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Related NGSS Performance Expectations

MS-ESS2-5 Collect data to provide evidence for how the motions and complex interactions of air masses result in changes in weather conditions.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Weath-1 Use local weather condition data to describe patterns over time.

SCI.EE.5.ESS.Weath-1 Determine patterns in weather data to help predict future weather.

SCI.EE.8.ESS.Weath-1 Determine the weather data needed to describe patterns in the movement of air masses that likely cause changes in weather.

SCI.EE.8.ESS.Weath-2 Use information to describe the relationships between regional climates, locations on Earth, geographic features, and weather.

SCI.EE.12.ESS.Weath-1 Use data to determine the relationship between the absorption of the Sun's energy by Earth's spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere) and trends in average global temperature.

SCI.EE.12.ESS.Weath-2 Ask questions to describe the relationship between human activity and global average temperature.

Students who demonstrate understanding can:

SCI.EE.8.ESS.Weath-2

Use information to describe the relationships between regional climates, location on Earth, geographic features, and weather.

DLM Disciplinary Core Idea Family

Weather and Climate

- Weather and climate are influenced by interactions involving sunlight, ice, bodies of water, and landforms. These interactions vary with latitude, altitude, and local and regional geography.
- Weather is a specific event, such as a rainstorm or hot day that happened over a few hours, days, or weeks. Weather can change from hour to hour or even year to year.
- Climate is the long-term pattern of weather in a particular area. The region's average weather patterns, usually tracked for at least 30 years, are considered its climate.
- Different parts of the world have different climates.
 - Tropical wet climates occur in parts of the world near the equator that are hot and rainy nearly every day.
 - Polar climates occur in parts of the world near the poles that are cold and snow-covered most of the year.
 - Between the icy poles and the steamy tropics are many other climates that contribute to Earth's biodiversity.
- The climate of an area in which air masses originate eventually affects the weather in other areas.
- It has been observed that Earth's global climate is getting warmer.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 6–8 builds on K–5 experiences and progresses to combining information to describe and support scientific claims and ideas.

- Decide which observations, images, texts, data, and other media are useful for defining problems and determining how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to answer scientific questions and evaluate scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.

- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- Time, space, and energy phenomena can be observed at various scales using models to study systems that are too large or too small.
- The observed function of natural and designed systems may change with scale.
- Proportional relationships (e.g., speed as the ratio of distance traveled to time taken) among different types of quantities provide information about the magnitude of properties and processes.
- Scientific relationships can be represented through the use of algebraic expressions and equations.
- Phenomena that can be observed at one scale may not be observable at another scale.

Related NGSS Performance Expectations

MS-ESS2-6 Develop and use a model to describe how unequal heating and rotation of the Earth cause patterns of atmospheric and oceanic circulation that determine regional climates.

MS-ESS3-5 Ask questions to clarify evidence of the factors that have caused the rise in global temperatures over the past century.

Students who demonstrate understanding can:

SCI.EE.8.ESS.Impact-1

Evaluate solutions that reduce the impacts of severe weather on humans.

DLM Disciplinary Core Idea Family

Reducing Impacts of Severe Weather

- A variety of harmful impacts can result from severe weather, which can occur suddenly with little warning.
- Severe weather in a specific region can be predicted, but sometimes predictions are inaccurate.
- A situation that people want to change or create can be approached as a problem to be solved through engineering.
- Before designing a solution to solve a problem, it is important to clearly understand the problem.
- Asking questions, making observations, and gathering information help to understand problems.
- The success of a designed solution is determined by considering the desired features of a solution (i.e., criteria).
- Different solutions need to be evaluated in order to determine which of them best solves the problem, given the criteria and constraints.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.
- Use information to evaluate solutions in the designed world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.

SCI.EE.5.ESS.Impact-1 Explain how a design solution reduces the impacts of severe weather on humans.

SCI.EE.8.ESS.Impact-1 Evaluate solutions that reduce the impacts of severe weather on humans.

SCI.EE.12.ESS.Impact-1 Improve a solution that reduces the impacts of severe weather on humans.

Students who demonstrate understanding can:

SCI.EE.8.PS.Matter-1 **Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.**

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Matter (i.e., substances) is made of different types of particles.
- Matter can exist as solids, liquids, or gases depending on temperature. The changes of state that occur with variations in temperature can be described and predicted using particle models of matter.
- In a solid, particles are closely spaced and vibrate in position but do not change relative locations.
- Gases and liquids are made of particles that are moving about relative to each other.
 - In a liquid, the particles are constantly in contact with each other; in a gas, they are widely spaced except when they happen to collide.
 - Gases are made of particles that are moving freely around in space.
- The changes of state that occur with variations in temperature can be described and predicted using these particle models of matter (see SCI.EE.8.PS.Energy-1 and SCI.EE.8.PS.Energy-2).
 - Usually, the change occurs when adding or removing heat. The nature of the phase change depends on the direction of the heat transfer.
 - Heat going into a substance changes it from a solid to a liquid or a liquid to a gas.
 - Particles of matter generally move more or faster when heated.
 - Removing heat from a substance changes a gas to a liquid or a liquid to a solid.
 - Particles of matter generally move less or slower when cooled.
- Bulk properties of states of matter that can be observed or measured can include the ability to move or flow, the ability to take the shape of a container, the ability to hold its shape or volume, etc.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.

- Models are limited in that they only represent certain aspects of the system under study.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g., energy in fields, thermal energy, energy of motion).
- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-PS1-4 Develop a model that predicts and describes changes in particle motion, temperature, and state of a pure substance when thermal energy is added or removed.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Matter-1 Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.

SCI.EE.5.PS.Matter-1 Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

SCI.EE.5.PS.Matter-2 Use evidence to support a claim that matter exists even when it cannot be seen.

SCI.EE.8.PS.Matter-1 Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.

SCI.EE.8.PS.Matter-2 Gather and use data to support the law of conservation of mass when substances change.

SCI.EE.8.PS.Matter-3 Gather and use data to determine whether an interaction between substances results in the formation of a new substance.

SCI.EE.12.PS.Matter-1 Use a model to describe that substances are made of different types and numbers of atoms.

SCI.EE.12.PS.Matter-2 Use a model to describe that in chemical reactions, the atoms in the starting substances (i.e., the reactants) rearrange to form new substances (i.e., the products).

SCI.EE.12.PS.Matter-3 Based on data, describe how the temperature and amount (i.e., concentration) of reacting substances affect the rates of chemical reactions.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.8.PS.Matter-2

Gather and use data to determine whether an interaction between substances results in the formation of a new substance.

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Matter (i.e., substances) is made of different types of particles.
- When two or more substances interact, they can chemically react to form a new substance (or substances). The properties of the new substance(s) are different than the properties of the original substances.
- (Pure) substances have characteristic physical and chemical properties (for any bulk quantity under given conditions) that can be used to identify them.
 - Bulk properties that can be observed or measured can include mass, hardness, brittleness, moldability, volume, odor, solubility, flammability, combustibility, conductivity, ability to flow or move, ability to take shape of container, pressure, etc.
 - If substances have different properties, they must be comprised of different particles.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 6–8 builds on K–5 experiences and progresses to collecting data during investigations to examine and support claims.

- Gather and use data to determine answers to scientific questions.
- Use observations and measurements to determine and support cause-and-effect relationships between variables.

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.
- Graphs, charts, and images can be used to identify patterns in data.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.
- Cause and effect relationships may be used to predict phenomena in natural or designed systems.
- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g., energy in fields, thermal energy, energy of motion).
- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-PS1-2 Analyze and interpret data on the properties of substances before and after the substances interact to determine if a chemical reaction has occurred.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Matter-1 Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.

SCI.EE.5.PS.Matter-1 Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

SCI.EE.5.PS.Matter-2 Use evidence to support a claim that matter exists even when it cannot be seen.

SCI.EE.8.PS.Matter-1 Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.

SCI.EE.8.PS.Matter-2 Gather and use data to support the law of conservation of mass when substances change.

SCI.EE.8.PS.Matter-3 Gather and use data to determine whether an interaction between substances results in the formation of a new substance.

SCI.EE.12.PS.Matter-1 Use a model to describe that substances are made of different types and numbers of atoms.

SCI.EE.12.PS.Matter-2 Use a model to describe that in chemical reactions, the atoms in the starting substances (i.e., the reactants) rearrange to form new substances (i.e., the products).

SCI.EE.12.PS.Matter-3 Based on data, describe how the temperature and amount (i.e., concentration) of reacting substances affect the rates of chemical reactions.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.8.PS.Matter-3

Gather and use data to support the law of conservation of mass when substances change.

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Conservation of matter: Matter is neither created nor destroyed.
 - The mass of starting substances equals the mass of the ending substances during a chemical or physical phase change in a closed system.
 - Data that can serve as evidence of the conservation of matter could include observations like smoke, bubbles, odor, balloon expansion, masses of ending and beginning substances, etc.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 6–8 builds on K–5 experiences and progresses to collecting data during investigations to examine and support claims.

- Gather and use data to determine answers to scientific questions.
- Use observations and measurements to determine and support cause-and-effect relationships between variables.

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 6–8 builds on K–5 experiences and progresses to use information to make and evaluate claims about the natural world.

- Use observations, information, data, or a model to evaluate a claim.
- Gather and use information as evidence to support a claim.
- Use information to make cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g., energy in fields, thermal energy, energy of motion).
- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-PS1-5 Develop and use a model to describe how the total number of atoms does not change in a chemical reaction and thus mass is conserved.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Matter-1 Make observations to classify different kinds (e.g., wood, metal, water) and forms (i.e., solid, liquid) of matter.

SCI.EE.5.PS.Matter-1 Make observations and measurements to describe changes in the physical properties of substances when heated, cooled, or mixed.

SCI.EE.5.PS.Matter-2 Use evidence to support a claim that matter exists even when it cannot be seen.

SCI.EE.8.PS.Matter-1 Use a particle model of matter to describe the relationships between the states of matter, their characteristics and properties, and temperature.

SCI.EE.8.PS.Matter-2 Gather and use data to support the law of conservation of mass when substances change.

SCI.EE.12.PS.Matter-2 Use a model to describe that in chemical reactions, the atoms in the starting substances (i.e., the reactants) rearrange to form new substances (i.e., the products).

SCI.EE.12.PS.Matter-3 Based on data, describe how the temperature and amount (i.e., concentration) of reacting substances affect the rates of chemical reactions.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.8.PS.Forces-1

Use observations and measurements to determine how an object's mass affects the force needed to change its motion.

DLM Disciplinary Core Idea Family

Interacting Forces

- The motion of an object depends on the total forces acting on that object (see SCI.EE.5.PS.Forces-1).
- Newton's third law of motion: For any pair of interacting objects, the forces exerted by each object on the other are equal and opposite. In other words, the force exerted by the first object on the second object is equal to the force that the second object exerts on the first but in the opposite direction.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 6–8 builds on K–5 experiences and progresses to representing and evaluating data to support explanations about relationships and solutions to problems in the natural world.

- Gather and represent data to determine and describe patterns.
- Evaluate data to construct and support explanations.
- Analyze data to evaluate solutions to problems.

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 6–8 builds on K–5 experiences and progresses to collecting data during investigations to examine and support claims.

- Gather and use data to determine answers to scientific questions.
- Use observations and measurements to determine and support cause-and-effect relationships between variables.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 6–8 builds on K–5 experiences and progresses to using and applying data and mathematical concepts to understand cause-and-effect relationships in the natural and designed world.

- Apply mathematical concepts and processes to determine and describe cause-and-effect relationships between variables.
- Use mathematical representations and reasoning to compare characteristics of components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.
- Patterns can be used to identify cause and effect relationships.

- Phenomena may have more than one cause, and some cause and effect relationships in systems can only be described using probability.

Related NGSS Performance Expectations

MS-PS2-1 Apply Newton's Third Law to design a solution to a problem involving the motion of two colliding objects.

MS-PS2-2 Plan an investigation to provide evidence that the change in an object's motion depends on the sum of the forces on the object and the mass of the object.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Forces-1 Make observations to compare the effects of different strengths and directions of pushes and pulls on the motion of an object.

SCI.EE.5.PS.Forces-1 Make observations to determine the effects of balanced and unbalanced forces on the motion (i.e., speed and direction) of an object.

SCI.EE.5.PS.Forces-2 Provide evidence that some objects (e.g., magnets, metals, pith balls, objects falling toward Earth) exert forces on each other even when the objects are not in contact.

SCI.EE.8.PS.Forces-1 Use observations and measurements to determine how an object's mass affects the force needed to change its motion.

SCI.EE.8.PS.Forces-2 Make observations of the motion of two colliding objects to provide evidence of Newton's third law.

SCI.EE.12.PS.Forces-1 Conduct an investigation to describe the relationships between force, mass, and acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.8.PS.Forces-2

Make observations of the motion of two colliding objects to provide evidence of Newton’s third law.

DLM Disciplinary Core Idea Family

Interacting Forces

- The motion of an object depends on the total forces acting on that object (see SCI.EE.5.PS.Forces-1).
- The greater the mass of the object, the greater the force needed to achieve the same change in motion.
 - A stronger force is needed to move a more massive object.
 - A stronger force moves a more massive object faster or farther.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 6–8 builds on K–5 experiences and progresses to collecting data during investigations to examine and support claims.

- Gather and use data to determine answers to scientific questions.
- Use observations and measurements to determine and support cause-and-effect relationships between variables.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 6–8 builds on K–5 experiences and progresses to using and applying data and mathematical concepts to understand cause-and-effect relationships in the natural and designed world.

- Apply mathematical concepts and processes to determine and describe cause-and-effect relationships between variables.
- Use mathematical representations and reasoning to compare characteristics of components of a system.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 6–8 builds on K–5 experiences and progresses to use information to make and evaluate claims about the natural world.

- Use observations, information, data, or a model to evaluate a claim.
- Gather and use information as evidence to support a claim.
- Use information to make cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Macroscopic patterns are related to the nature of microscopic and atomic-level structure.
- Patterns in rates of change and other numerical relationships can provide information about natural and human designed systems.

SCI.EE.8.PS.Forces-2 Make observations of the motion of two colliding objects to provide evidence of Newton's third law.

SCI.EE.12.PS.Forces-1 Conduct an investigation to describe the relationships between force, mass, and acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.8.PS.Energy-1

Develop a model to infer the relationship between the kinetic energy and temperature of an object or particles of a substance.

DLM Disciplinary Core Idea Family

Energy

- Motion energy is called kinetic energy (at both the macro and micro scales).
- The faster particles or objects move or vibrate, the greater the kinetic energy.
- Temperature* can serve as a measure of the average kinetic energy (i.e., motion) of particles of matter.
 - The higher the total kinetic energy of particles or objects, the higher the temperature (i.e., thermal energy of matter).
 - The term heat refers to the motion of particles of matter (i.e., the thermal energy of matter). The particles of hot substances move more or faster relative to particles of cold substances.
 - Because the energy of an object cannot be directly observed or measured, the energy of a system can be inferred from a measurement of its temperature.

* The relationship between the temperature and the total energy of a system depends on the types, states, and amounts of matter present (see SCI.EE.8.PS.Matter-1).

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 6–8 builds on K–5 experiences and progresses to constructing explanations about processes or relationships in the natural or designed world.

- Use information, data, or models to construct descriptions and explanations of processes and cause-and-effect relationships in the natural world.
- Use information to evaluate solutions in the designed world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems may interact with other systems; they may have sub-systems and be a part of larger complex systems.
- Models can be used to represent systems and their interactions—such as inputs, processes and outputs—and energy, matter, and information flows within systems.
- Models are limited in that they only represent certain aspects of the system under study.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- Matter is conserved because atoms are conserved in physical and chemical processes.
- Within a natural or designed system, the transfer of energy drives the motion and/or cycling of matter.
- Energy may take different forms (e.g., energy in fields, thermal energy, energy of motion).
- The transfer of energy can be tracked as energy flows through a designed or natural system.

Related NGSS Performance Expectations

MS-PS1-4 Develop a model that predicts and describes changes in particle motion, temperature, and state of a pure substance when thermal energy is added or removed.

MS-PS3-1 Construct and interpret graphical displays of data to describe the relationships of kinetic energy to the mass of an object and to the speed of an object.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Energy-1 Make observations that energy exists.

SCI.EE.5.PS.Energy-1 Use observations to support a claim about the amount of energy moved from one place to another by sound, light, heat, and moving objects.

SCI.EE.8.PS.Energy-1 Develop a model to infer the relationship between the kinetic energy and temperature of an object or particles of a substance.

SCI.EE.8.PS.Energy-2 Provide evidence that kinetic energy is transferred between two objects when they collide with each other.

SCI.EE.8.PS.Energy-3 Develop a model to describe the behavior of light (i.e., transmission, reflection, scattering) that comes into contact with objects made of different materials.

SCI.EE.12.PS.Energy-1 Gather data to describe the thermal energy transfer between two objects or substances in contact with each other.

SCI.EE.12.PS.Energy-2 Ask questions to describe the relationship between sound energy and the vibrations of particles of matter.

Students who demonstrate understanding can:

SCI.EE.8.PS.Energy-2

Provide evidence that kinetic energy is transferred between two objects when they collide with each other.

DLM Disciplinary Core Idea Family

Energy

- Energy cannot be created or destroyed.
- When objects collide, kinetic energy can flow (i.e., transfer) from one object to another.
 - When two objects are in contact, each one exerts a force on the other that can cause kinetic energy to be transferred from one object to another (see SCI.EE.8.PS.Forces-2).
 - When kinetic energy is transferred from one object to another, the motion of those objects can change.
 - Examples could include the changes in motion that occur when a moving marble collides with a stationary marble or when two moving marbles collide.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 6–8 builds on K–5 experiences and progresses to developing and using questions to clarify information and define problems.

- Classify and compare information that answers questions about how the natural world works.
- Develop questions that can be answered by an investigation.
- Ask questions that help to define a simple design problem.

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 6–8 builds on K–5 experiences and progresses to collecting data during investigations to examine and support claims.

- Gather and use data to determine answers to scientific questions.
- Use observations and measurements to determine and support cause-and-effect relationships between variables.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 6–8 builds on K–5 experiences and progresses to use information to make and evaluate claims about the natural world.

- Use observations, information, data, or a model to evaluate a claim.
- Gather and use information as evidence to support a claim.
- Use information to make cause-and-effect claims.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.

SCI.EE.12.PS.Energy-1 Gather data to describe the thermal energy transfer between two objects or substances in contact with each other.

SCI.EE.12.PS.Energy-2 Ask questions to describe the relationship between sound energy and the vibrations of particles of matter.

Students who demonstrate understanding can:

SCI.EE.8.PS.Energy-3

Develop a model to describe the behavior of light (i.e., transmission, reflection, scattering) that comes into contact with objects made of different materials.

DLM Disciplinary Core Idea Family

Energy

- Light allows us to see our world and gain visual information.
- Light waves can move through empty spaces. (This is why we can see stars even though they are far away.)
- When light shines on an object, it is reflected, absorbed, or transmitted through the object, depending on the object's material.
 - Depending on the type of matter it comes into contact with, light will behave differently.
 - Sometimes light will pass directly through the matter, like with air or water (i.e., transparent matter).
 - Other objects, like an animal or a book (i.e., opaque matter), blocks light from passing through them. Reflection of light occurs when it hits a surface that, instead of absorbing light, bounces the light away from the surface. Absorption of light occurs when light is neither reflected by nor transmitted through an object.
 - A third type of object does some of both (i.e., transmit and reflect) and tends to scatter the light in all directions (i.e., translucent matter).
 - Light travels from its source to another location in a straight path, except at surfaces between different transparent materials (e.g., air and water, air and glass) where the light path bends.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 6–8 builds on K–5 experiences and progresses to developing and using models (e.g., diagram, drawing, physical replica, diorama, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop and use models to identify, describe, and compare components of a system.
- Use models to explain and predict relationships between variables and components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Relationships can be classified as causal or correlational, and correlation does not necessarily imply causation.

Students who demonstrate understanding can:

SCI.EE.12.LS.Org-1 **Use a model to construct an explanation of how systems of specialized cells within organisms work together to perform essential functions of life.**

DLM Disciplinary Core Idea Family

Organisms: Structure and Function, Growth and Development

- Living things are made up of a system of specialized cells.
- Groups of cells work together to form systems of cells (examples of tissue could include muscle or nerve).
- Systems of cells form organs (e.g., heart, lung, ear) and organ systems (e.g., circulatory system, respiratory system).
- Organs and organ systems perform specific body functions.
- Organs and organ systems interact to perform life functions of an organism.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in 9–12 builds on K–8 experiences and progresses to developing, using, and evaluating models (e.g., maps, diagram, drawing, physical replica, diorama, graphs, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop, use, and evaluate models to describe relationships between variables and components of a system.
- Use models to construct and evaluate explanations in the natural world.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to constructing and evaluating explanations about processes or relationships in the natural or designed world.

- Gather and use information to construct descriptions and explanations of processes and relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

System and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- Investigating or designing new systems or structures requires a detailed examination of the properties of different materials, the structures of different components, and connections of components to reveal its function and/or solve a problem.
- The functions and properties of natural and designed objects and systems can be inferred from their overall structure, the way their components are shaped and used, and the molecular substructures of its various materials.

Related NGSS Performance Expectations

Students who demonstrate understanding can:

SCI.EE.12.LS.Plant-1

Use a model to explain the role of plants in the flow of energy and matter among organisms in the ecosystem.

DLM Disciplinary Core Idea Family

Plants: Cycling of Matter and Flow of Energy

- The energy released from food was once energy from the Sun that was captured by plants in the process that forms plant matter (from air and water).
 - The main way solar energy is captured and stored on Earth is through the process of plants making food.
 - Plants make their own food and are a source of food for animals.
 - Plants capture and use energy from the Sun and matter in the environment (water and air) to make food (plant matter), releasing air (i.e., oxygen). (The chemical equation, elements, and compounds in the process of photosynthesis are not included.)
 - Matter for much of life comes from this process (i.e., plants capture sunlight, water, and air from the environment to produce plant matter that is transferred to the rest of the ecosystem).
 - As food matter is transferred among organisms in a living system, the matter is broken down and rearranged into new groupings of atoms (see SCI.EE.12.PS.Matter-2).
- Energy for much of life comes from this process (i.e., the sunlight captured by plants is transferred to the rest of the ecosystem via food).
 - Energy is transferred from organism to organism within (i.e., flows through) an ecosystem.
 - Organisms are related in food webs in which some animals eat plants for food and other animals eat the animals that eat plants.
 - Food webs model how matter and energy are transferred among producers, consumers, and decomposers as the three groups interact within an ecosystem.
 - Energy and matter from plants are used by animals for body repair, growth, reproduction, and motion or are stored for later use.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in 9–12 builds on K–8 experiences and progresses to developing, using, and evaluating models (e.g., maps, diagram, drawing, physical replica, diorama, graphs, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop, use, and evaluate models to describe relationships between variables and components of a system.
- Use models to construct and evaluate explanations in the natural world.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in 9–12 builds on K–8 experiences and progresses to constructing and evaluating explanations about processes or relationships in the natural or designed world.

- Gather and use information to construct descriptions and explanations of processes and relationships in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- The total amount of energy and matter in closed systems is conserved.

- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system.
- Energy cannot be created or destroyed—only moves between one place and another place, between objects and/or fields, or between systems.
- Energy drives the cycling of matter within and between systems.
- In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.

Related NGSS Performance Expectations

HS-LS1-5 Use a model to illustrate how photosynthesis transforms light energy into stored chemical energy.

HS-LS1-7 Use a model to illustrate that cellular respiration is a chemical process whereby the bonds of food molecules and oxygen molecules are broken and the bonds in new compounds are formed, resulting in a net transfer of energy.

HS-LS2-4 Use mathematical representations to support claims for the cycling of matter and flow of energy among organisms in an ecosystem.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Plant-1 Investigate what plants need to grow.

Students who demonstrate understanding can:

SCI.EE.12.LS.Ecosys-1 **Develop a model that describes how matter (plant or animal matter) and energy (i.e., sunlight and food energy) are cycled within an ecosystem.**

DLM Disciplinary Core Idea Family

Ecosystem: Cycling of Matter and Flow of Energy

- Matter and energy flow through living systems.
- Matter and energy are cycled and transferred from one system to another.
- Food webs model how matter and energy are transferred among producers, consumers, and decomposers as the three groups interact within an ecosystem.
- The energy released from food was once energy from the Sun that was captured by plants in the process that forms plant matter (from air and water) (see SCI.EE.12.LS.Plant-1).
- As food matter is transferred among organisms in a living system, the matter is broken down and rearranged into new groupings of atoms (see SCI.EE.12.PS.Matter-2). This process provides organisms with matter and energy for life.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in 9–12 builds on K–8 experiences and progresses to developing, using, and evaluating models (e.g., maps, diagram, drawing, physical replica, diorama, graphs, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop, use, and evaluate models to describe relationships between variables and components of a system.
- Use models to construct and evaluate explanations in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

- Energy drives the cycling of matter within and between systems.
- In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.

Related NGSS Performance Expectations

HS-LS2-3 Construct and revise an explanation based on evidence for the cycling of matter and flow of energy in aerobic and anaerobic conditions.

HS-LS2-4 Use mathematical representations to support claims for the cycling of matter and flow of energy among organisms in an ecosystem.

HS-LS2-5 Develop a model to illustrate the role of photosynthesis and cellular respiration in the cycling of carbon among the biosphere, atmosphere, hydrosphere, and geosphere.

HS-LS1-5 Use a model to illustrate how photosynthesis transforms light energy into stored chemical energy.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Ecosys-1 Use information to support that animals need food to live and grow.

SCI.EE.5.LS.Ecosys-1 Use data to support that food provides animals with the materials and energy they need for body repair, growth, warmth, and motion.

SCI.EE.8.LS.Ecosys-1 Use a model to describe the transfer of food (i.e., matter and energy) between plants, animals, and decomposers.

SCI.EE.12.LS.Ecosys-1 Develop a model that describes how matter (plant or animal matter) and energy (i.e., sunlight and food energy) are cycled within an ecosystem.

Students who demonstrate understanding can:

SCI.EE.12.LS.EcoHlth-1

Use data to make an argument about the effects of unstable environments on the health of ecosystems.

DLM Disciplinary Core Idea Family

Ecosystem Health

- A healthy ecosystem can support the needs of diverse populations. Therefore, a healthy ecosystem supports biodiversity.
- Resource availability determines where animals and humans live.
- Ecosystems have limits on organisms and populations.
 - Limits on ecosystems are based on resource availability (both living and nonliving resources).
 - Limiting factors slow or stop population growth. Examples may include predation, competition, disease, immigration of species, weather, food, and water availability.
- Unstable environments impact populations of animals and plants.
 - An unstable ecosystem is unable to resist disturbances and quickly return to its average state after a disturbance.
 - Disturbances or disruptions to living and nonliving factors in ecosystems affect the populations living there.
 - Unstable environments may be caused by a variety of factors such as drought, flood, migration, immigration, invasive species, disease, an unhealthy predator-to-prey ratio, etc.
 - Unstable environments can decrease biodiversity.
 - Changes in biodiversity affect populations' access to living and nonliving resources. This includes humans.
 - Human activity can disrupt or disturb ecosystems.
 - Changes in weather and climate impact ecosystems.
- Earth's spheres interact, impacting ecosystems.
 - The biosphere and geosphere dynamically interact: Living organisms (biosphere) have impacted Earth's spheres (hydrosphere, geosphere, and atmosphere) and vice versa.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 9–12 builds on K–8 experiences and progresses to evaluating information to construct arguments about the natural world.

- Use observations, information, data, models, and mathematical reasoning to develop and evaluate cause-and-effect claims.
- Use information to construct an argument.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Much of science deals with constructing explanations of how things change and how they remain stable.
- Change and rates of change can be quantified and modeled over very short or very long periods of time. Some system changes are irreversible.
- Feedback (negative or positive) can stabilize or destabilize a system.
- Systems can be designed for greater or lesser stability.

Related NGSS Performance Expectations

HS-LS2-1 Use mathematical and/or computational representations to support explanations of factors that affect carrying capacity of ecosystems at different scales.

HS-LS2-2 Use mathematical representations to support and revise explanations based on evidence about factors affecting biodiversity and populations in ecosystems of different scales.

HS-LS2-6 Evaluate claims, evidence, and reasoning that the complex interactions in ecosystems maintain relatively consistent numbers and types of organisms in stable conditions, but changing conditions may result in a new ecosystem.

HS-LS2-7 Design, evaluate, and refine a solution for reducing the impacts of human activities on the environment and biodiversity.

HS-ESS2-2 Analyze geoscience data to make the claim that one change to Earth’s surface can create feedbacks that cause changes to other Earth systems.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.EcoHlth-1 Use information to describe that many kinds of living things live in different habitats.

SCI.EE.5.LS.EcoHlth-1 Use information to support that healthy ecosystems meet the needs of many varieties and types of organisms.

SCI.EE.5.LS.EcoHlth-2 Ask questions to determine how living things (both plants and animals) impact the habitat in which they live.

SCI.EE.8.LS.EcoHlth-1 Use data to explain the relationship between organisms’ survival and growth and their interactions with both living and nonliving factors in their ecosystem.

SCI.EE.12.LS.EcoHlth-1 Use data to make an argument about the effects of unstable environments on the health of ecosystems.

Students who demonstrate understanding can:

SCI.EE.12.LS.Group-1

Use data to support a claim about how group behavior affects individuals' and species' chances to survive.

DLM Disciplinary Core Idea Family

Group Survival Behavior

- Being part of a group helps animals meet their survival needs (e.g., obtain food and water, defend themselves, raise young, cope with changes). Therefore, being in a group within a community increases the survival chances of individuals in the group.
- An increased chance of individuals' survival, in turn, increases the chance of reproduction between individuals, sustaining the population (or species).
- Group behaviors might include hunting, migrating, swarming, flocking, schooling, etc.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 9–12 builds on K–8 experiences and progresses to evaluating information to construct arguments about the natural world.

- Use observations, information, data, models, and mathematical reasoning to develop and evaluate cause-and-effect claims.
- Use information to construct an argument.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.

HS-LS2-8 Evaluate the evidence for the role of group behavior on individual and species' chances to survive and reproduce.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Group-1 Use information to identify that offspring learn survival behaviors.

SCI.EE.5.LS.Group-1 Provide evidence that animals gain information for survival through their senses.

SCI.EE.8.LS.Group-1 Use information to explain the relationship between animals' abilities to sense and communicate information and the response behaviors that help them grow and survive.

SCI.EE.12.LS.Group-1 Use data to support a claim about how group behavior affects individuals' and species' chances to survive.

Students who demonstrate understanding can:

SCI.EE.12.LS.Trait-1

Use information to support a claim that heredity and the environment influence the traits of an individual.

DLM Disciplinary Core Idea Family

Traits of Organisms

- Traits are passed down from parents to offspring. Therefore, characteristics of individuals are affected by heredity before they are born.
 - The characteristics inherited by offspring from the same parents vary, resulting in related organisms with diverse traits.
 - Offspring exhibit different phenotypes, affecting how they look and function.
- The environment also affects the traits an organism develops.
 - Environmental influences on traits can include resource availability, population density, ability to camouflage to escape predation, disease, change in climate (temperature, precipitation, wind, and amount of sunlight), soil composition, etc.
- Traits and characteristics of organisms influence the organisms' functions and behaviors. Behaviors and functions that allow for survival in a specific environment influence what traits are inherited. Traits that support survival become common in a population and those that do not support survival become less common. Therefore, the distribution of traits in a population can change.

DLM Science and Engineering Practices

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 9–12 builds on K–8 experiences and progresses to evaluating information to construct arguments about the natural world.

- Use observations, information, data, models, and mathematical reasoning to develop and evaluate cause-and-effect claims.
- Use information to construct an argument.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 9–12 builds on K–8 experiences and progresses to comparing and combining multiple sources of information to communicate and evaluate scientific claims and ideas.

- Combine multiple observations, images, texts, data, and other media to evaluate problems and explanations of how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to pose scientific questions and scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.
- Classifications or explanations used at one scale may fail or need revision when information from smaller or larger scales is introduced; thus requiring improved investigations and experiments.
- Patterns of performance of designed systems can be analyzed and interpreted to reengineer and improve the system.
- Mathematical representations are needed to identify some patterns.
- Empirical evidence is needed to identify patterns.

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Related NGSS Performance Expectations

HS-LS3-1 Ask questions to clarify relationships about the role of DNA and chromosomes in coding the instructions for characteristic traits passed from parents to offspring.

HS-LS4-2 Construct an explanation based on evidence that the process of evolution primarily results from four factors: (1) the potential for a species to increase in number, (2) the heritable genetic variation of individuals in a species due to mutation and sexual reproduction, (3) competition for limited resources, and (4) the proliferation of those organisms that are better able to survive and reproduce in the environment.

HS-LS4-3 Apply concepts of statistics and probability to support explanations that organisms with an advantageous heritable trait tend to increase in proportion to organisms lacking this trait.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.LS.Trait-1 Use information to show that organisms (both plants and animals) may resemble their biological parents but are not identical to their parents.

SCI.EE.5.LS.Trait-1 Use information to describe that different organisms vary in how they look due to the traits passed down from their parents.

SCI.EE.8.LS.Trait-1 Use information to determine how the environment affects organisms' traits and their survival.

SCI.EE.12.LS.Trait-1 Use information to support a claim that heredity and the environment influence the traits of an individual.

SCI.EE.12.LS.Trait-2 Use mathematical reasoning to support relationships between changing environmental conditions, adaptation by natural selection, and changes in the distribution of traits within a population.

Students who demonstrate understanding can:

SCI.EE.12.LS.Trait-2

Use mathematical reasoning to support relationships between changing environmental conditions, adaptation by natural selection, and changes in the distribution of traits within a population.

DLM Disciplinary Core Idea Family

Traits of Organisms

- The distribution of expressed traits in a population result from (1) the potential for a species to reproduce and increase in number, (2) heritable traits due to reproduction, (3) competition for limited resources, and (4) the proliferation of those organisms that are better able to survive and reproduce in the environment.
- Adaptation impacts the distribution of traits in a population as changes in conditions occur.
 - Species' characteristics can change over generations in response to changes in environmental conditions. (Environmental changes can occur naturally or due to human activities.)
 - Natural selection may lead to increases and decreases of specific traits in populations over time.
 - Traits that increase the chance of survival are passed down from parents to offspring through reproduction, becoming more common within the population. Traits that do not increase the chance of survival are not passed down to offspring, becoming less common within the population.

DLM Science and Engineering Practices

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 9–12 builds on K–8 experiences and progresses to analyzing and interpreting data and mathematical concepts to construct meaning about systems in the natural and designed world.

- Use mathematical reasoning to construct and support claims about the cause-and-effect relationships between variables.
- Analyze and interpret data to investigate the relationships and characteristics of the components of a system.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 9–12 builds on K–8 experiences and progresses to evaluating information to construct arguments about the natural world.

- Use observations, information, data, models, and mathematical reasoning to develop and evaluate cause-and-effect claims.
- Use information to construct an argument.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- The significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs.
- Some systems can only be studied indirectly as they are too small, too large, too fast, or too slow to observe directly.
- Patterns observable at one scale may not be observable or exist at other scales.
- Using the concept of orders of magnitude allows one to understand how a model at one scale relates to a model at another scale.
- Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth).

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Much of science deals with constructing explanations of how things change and how they remain stable.
- Change and rates of change can be quantified and modeled over very short or very long periods of time. Some system changes are irreversible.
- Feedback (negative or positive) can stabilize or destabilize a system.
- Systems can be designed for greater or lesser stability.

Students who demonstrate understanding can:

SCI.EE.12.LS.Human-1 **Evaluate design solutions that minimize the effects of human activities on the health of ecosystems.**

DLM Disciplinary Core Idea Family

Human Impacts on Ecosystems

- Resource availability determines where animals and humans live. Limits on ecosystems are based on resource availability (both living and nonliving resources).
- Biodiversity is essential to maintain ecosystems and life on Earth. Changes to living and nonliving parts of an ecosystem affect the biodiversity of the organisms living there.
- Humans face challenges in meeting their needs and protecting the environment.
 - Human activity and their dependence on natural resources (see SCI.EE.12.ESS.Earth-2) are adversely affecting biodiversity. (Examples of activities could include deforestation, air and water pollution, soil health, and dramatic change in animal or plant population.)
 - To sustain both human life and biodiversity, humans need to make responsible decisions in how they use natural resources.
- Science and engineering can be used to reduce the impacts of human activity on natural resources and biodiversity.
- Different solutions need to be evaluated in order to determine which of them best solves the problem, given the criteria and constraints. (Examples of solutions could include planting trees and reintroducing species.)

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 9–12 builds on K–8 experiences and progresses to constructing and evaluating explanations about processes or relationships in the natural or designed world.

- Gather and use information to construct descriptions and explanations of processes and relationships in the natural world.
- Use data and models to evaluate and improve design solutions.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Mechanism and Prediction: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

Students who demonstrate understanding can:

SCI.EE.12.ESS.SolSys-1

Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star’s mass and distance from Earth.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- Stars (including the Sun) spontaneously release energy. Through sunlight, that energy is transferred from the Sun to Earth.
- The light from stars transferred to Earth varies depending on the stars’ masses and distances from the Sun.
 - Generally, the larger a star’s mass, the greater the energy it releases.
 - Generally, the closer a star is to Earth, the brighter it appears.
 - The brightness of a star as seen from Earth is directly related to the amount of energy it transfers to Earth.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 9–12 builds on K–8 experiences and progresses to analyzing and interpreting data and mathematical concepts to construct meaning about systems in the natural and designed world.

- Use mathematical reasoning to construct and support claims about the cause-and-effect relationships between variables.
- Analyze and interpret data to investigate the relationships and characteristics of the components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.
- Classifications or explanations used at one scale may fail or need revision when information from smaller or larger scales is introduced; thus requiring improved investigations and experiments.
- Patterns of performance of designed systems can be analyzed and interpreted to reengineer and improve the system.
- Mathematical representations are needed to identify some patterns.
- Empirical evidence is needed to identify patterns.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- The significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs.
- Some systems can only be studied indirectly as they are too small, too large, too fast, or too slow to observe directly.
- Patterns observable at one scale may not be observable or exist at other scales.
- Using the concept of orders of magnitude allows one to understand how a model at one scale relates to a model at another scale.

- Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth).

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Related NGSS Performance Expectations

HS-ESS1-1 Develop a model based on evidence to illustrate the life span of the sun and the role of nuclear fusion in the sun’s core to release energy that eventually reaches Earth in the form of radiation.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.SolSys-1 Use observations to identify the daily patterns of celestial objects that can appear in the sky during daytime and nighttime.

SCI.EE.5.ESS.SolSys-1 Use data to support that the Sun appears to be the largest and brightest star in the sky because it is the closest star to Earth.

SCI.EE.5.ESS.SolSys-2 Use a model to explain the relationship between Earth’s rotation on its axis and the 24-hour cycle of nighttime and daytime.

SCI.EE.5.ESS.SolSys-3 Use data from different times of the year to determine seasonal patterns in the number of daylight hours.

SCI.EE.5.ESS.SolSys-4 Make observations to support that Earth’s gravity exerts a downward force on all objects on its surface.

SCI.EE.8.ESS.SolSys-1 Use models to compare the components of our solar system and describe the motions of those components.

SCI.EE.8.ESS.SolSys-2 Use a model of the Sun-Earth-Moon system to explain the relationship between the motion of the Moon and the cyclical patterns of its phases.

SCI.EE.8.ESS.SolSys-3 Use a model to explain the relationships between the orientation of Earth’s axis in relation to the Sun, Earth’s motion, and seasonal patterns in the number of daylight hours.

SCI.EE.8.ESS.SolSys-4 Use a model to describe the role of gravity in the motions of planets and their moons within the solar system.

SCI.EE.12.ESS.SolSys-1 Use mathematical reasoning to describe the relationships between the amount of energy released by a star that reaches Earth and the star’s mass and distance from Earth.

SCI.EE.12.ESS.SolSys-2 Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth’s surface and seasonal temperature patterns.

SCI.EE.12.ESS.SolSys-3 Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

Students who demonstrate understanding can:

SCI.EE.12.ESS.SolSys-2

Gather data to determine the relationship between the intensity and directness of sunlight reaching Earth’s surface and seasonal temperature patterns.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- Through sunlight, energy is transferred from the Sun to Earth (see SCI.EE.12.ESS.SolSys-1).
- As Earth orbits the Sun, the Earth’s tilt in relation to the Sun (toward or away from the Sun) results in seasonal temperature patterns.
- The seasonal temperature patterns are a result of the differential intensity of sunlight on different areas of Earth across the year.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 9–12 builds on K–8 experiences and progresses to developing, using, and evaluating models (e.g., maps, diagram, drawing, physical replica, diorama, graphs, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop, use, and evaluate models to describe relationships between variables and components of a system.
- Use models to construct and evaluate explanations in the natural world.

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.
- Classifications or explanations used at one scale may fail or need revision when information from smaller or larger scales is introduced; thus requiring improved investigations and experiments.
- Patterns of performance of designed systems can be analyzed and interpreted to reengineer and improve the system.
- Mathematical representations are needed to identify some patterns.
- Empirical evidence is needed to identify patterns.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Systems and Systems Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Students who demonstrate understanding can:

SCI.EE.12.ESS.SolSys-3

Analyze and interpret data to describe the relationships between the gravitational force between objects in the solar system, their masses, and the distance between them.

DLM Disciplinary Core Idea Family

Earth in the Solar System

- Gravity is an attractive force that results from mass and affects everything with mass. Therefore, every object with mass has gravity.
- The strength of the gravitational force between two objects depends on the mass of each object and the distance between them.
 - There is a gravitational force between any two masses, but it is very small except when one or both of the objects have large mass (e.g., Earth and the Sun, Earth and its Moon) between them.
 - There is a gravitational force between any two masses, but its strength decreases the further the objects are away from each other.
- The Sun is by far the most massive object in the solar system, so its gravitational pull is the strongest, which is why planets orbit the Sun.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.

Students who demonstrate understanding can:

SCI.EE.12.ESS.Earth-1

Use data to make a claim that a change to one of Earth's spheres can cause changes to other Earth's spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

DLM Disciplinary Core Idea Family

Earth Systems

- Earth's major systems are the geosphere, hydrosphere, atmosphere, and biosphere.
 - The geosphere refers to rock, soil, sediments, and landforms.
 - The hydrosphere refers to water and ice.
 - The atmosphere refers to air.
 - The biosphere refers to living things.
- These spheres are dynamic and interact amongst themselves.
 - These interactions have occurred for a long time and will continue to occur.
 - The changes resulting from these interactions can occur on different time scales, from immediate to long-term.
 - These interactions both positively and negatively affect the life of organisms.
- Examples may include:
 - a rise in global temperatures that melts glacial ice, which increases surface temperatures, further reducing the amount of ice.
 - a loss of ground vegetation causes an increase in water runoff and soil erosion.
 - a loss of water from wetlands causes a decrease in local humidity that decreases rain, which reduces the population of plants and animals living there.

DLM Science and Engineering Practices

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Engaging in Argument from Evidence: Engaging in argument from evidence in grades 9–12 builds on K–8 experiences and progresses to evaluating information to construct arguments about the natural world.

- Use observations, information, data, models, and mathematical reasoning to develop and evaluate cause-and-effect claims.
- Use information to construct an argument.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.

- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Much of science deals with constructing explanations of how things change and how they remain stable.
- Change and rates of change can be quantified and modeled over very short or very long periods of time. Some system changes are irreversible.
- Feedback (negative or positive) can stabilize or destabilize a system.
- Systems can be designed for greater or lesser stability.

Related NGSS Performance Expectations

HS-ESS2-7 Construct an argument based on evidence about the simultaneous coevolution of Earth’s systems and life on Earth.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.ESS.Earth-1 Use information to describe that different types of bodies of water are found in different locations on Earth’s surface.

SCI.EE.2.ESS.Earth-2 Use observations to describe that wind and water can change the shape of the land.

SCI.EE.5.ESS.Earth-1 Use a model to describe the distribution of fresh and salt water on Earth’s surface.

SCI.EE.5.ESS.Earth-2 Use information to describe that water is found in different forms almost everywhere on Earth.

SCI.EE.5.ESS.Earth-3 Use observations to explain how water, ice, wind, organisms, and gravity break rocks, soil, and sediments into smaller particles and move them around.

SCI.EE.8.ESS.Earth-1 Use a model to explain how water continuously cycles between the surface of Earth and the atmosphere.

SCI.EE.8.ESS.Earth-2 Use information to evaluate a claim about how the hydrosphere affects the shape of land (i.e., the geosphere) over time.

SCI.EE.12.ESS.Earth-1 Use data to make a claim that a change to one of Earth’s spheres can cause changes to other Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere).

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth’s systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.12.ESS.Earth-2

Ask questions to determine how a change in one of Earth's systems (i.e., spheres) affects humans.

DLM Disciplinary Core Idea Family

Earth Systems

- Earth's major systems are the geosphere, hydrosphere, atmosphere, and biosphere (see SCI.EE.12.ESS-Earth-1).
- These spheres are dynamic and interact amongst themselves (see SCI.EE.12.ESS-Earth-1).
 - Any natural substance that humans use can be considered a natural resource.
 - Resource availability determines where humans live.
 - Limits on ecosystems are based on resource availability (both living and nonliving resources).
 - Changes in biodiversity affect humans' access to living and non-living resources (see SCI.EE.12.LS-EcoHlth-1).

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 9–12 builds on K–8 experiences and progresses to developing and refining questions that lead to explanations.

- Develop and evaluate testable questions.
- Gain information through questioning to describe cause-and-effect relationships.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

SCI.EE.12.ESS.Earth-2 Ask questions to determine how a change in one of Earth's systems (i.e., spheres) affects humans.

Students who demonstrate understanding can:

SCI.EE.12.ESS.Weath-1 **Use data to determine the relationship between the absorption of the Sun’s energy by Earth’s spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere) and trends in average global temperature.**

DLM Disciplinary Core Idea Family

Weather and Climate

- Climate is the long-term pattern of weather in a particular area. The region’s average weather patterns, usually tracked for at least 30 years, are considered its climate (see SCI.EE.8.ESS.Weath-1).
- The transfer of energy from the Sun to Earth drives average global temperature (see SCI.EE.12.ESS-SolSys-1 and SCI.EE.12.ESS-SolSys-2).
- The Sun’s energy is absorbed and stored by Earth’s systems (atmosphere, hydrosphere, geosphere), which increases surface temperature (see SCI.EE.12.ESS-Earth-1).
- Climate change can occur when Earth’s atmosphere and hydrosphere are altered.
 - Human activity adds gases to the atmosphere (i.e., air) and hydrosphere (i.e., oceans) that absorb the Sun’s light energy and heat, which increases average global temperature.
 - Therefore, average global temperature is one indicator of a change in climate.
- Models predict that average global temperature will continue to rise.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- The total amount of energy and matter in closed systems is conserved.
- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system.
- Energy cannot be created or destroyed—only moves between one place and another place, between objects and/or fields, or between systems.
- Energy drives the cycling of matter within and between systems.
- In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.

Related NGSS Performance Expectations

HS-ESS2-4 Use a model to describe how variations in the flow of energy into and out of Earth's systems result in changes in climate.

HS-ESS2-6 Develop a quantitative model to describe the cycling of carbon among the hydrosphere, atmosphere, geosphere, and biosphere.

HS-ESS3-5 Create a computational simulation to illustrate the relationships among management of natural resources, the sustainability of human populations, and biodiversity.

HS-ESS3-6 Use a computational representation to illustrate the relationships among Earth systems and how those relationships are being modified due to human activity.

Articulation of the DCI Family Across Grade Bands

SCI.EE.5.ESS.Weath-1 Determine patterns in weather data to help predict future weather.

SCI.EE.8.ESS.Weath-1 Determine the weather data needed to describe patterns in the movement of air masses that likely cause changes in weather.

SCI.EE.8.ESS.Weath-2 Use information to describe the relationships between regional climates, locations on Earth, geographic features, and weather.

SCI.EE.12.ESS.Weath-1 Use data to determine the relationship between the absorption of the Sun's energy by Earth's spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere) and trends in average global temperature.

SCI.EE.12.ESS.Weath-2 Ask questions to describe the relationship between human activity and global average temperature.

Students who demonstrate understanding can:

SCI.EE.12.ESS.Weath-2 **Ask questions to describe the relationship between human activity and global average temperature.**

DLM Disciplinary Core Idea Family

Weather and Climate

- Human activity adds gases to the atmosphere (i.e., air) and hydrosphere (i.e., oceans) that absorb the Sun's light energy and heat, which increases average global temperatures (see SCI.EE.12.ESS-Weath-1).
 - Human activity (e.g., use of energy and fuels, habitat destruction) significantly impacts average global temperature.
 - Models predict that the average global temperature will continue to rise.
- Through the use of science, models, and computers, humans have the potential to identify their impact on average global temperature.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 9–12 builds on K–8 experiences and progresses to developing and refining questions that lead to explanations.

- Develop and evaluate testable questions.
- Gain information through questioning to describe cause-and-effect relationships.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Obtaining, Evaluating, and Communicating Information: Obtaining, evaluating, and communicating information in grades 9–12 builds on K–8 experiences and progresses to comparing and combining multiple sources of information to communicate and evaluate scientific claims and ideas.

- Combine multiple observations, images, texts, data, and other media to evaluate problems and explanations of how the natural world works.
- Combine information (e.g., observations, texts, tables, images, graphs, maps) to pose scientific questions and scientific ideas.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system's behavior.

- The total amount of energy and matter in closed systems is conserved.
- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system.
- Energy cannot be created or destroyed—only moves between one place and another place, between objects and/or fields, or between systems.
- Energy drives the cycling of matter within and between systems.
- In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.

Stability and Change: For both designed and natural systems, conditions that affect stability and factors that control rates of change are critical elements to consider and understand.

- Much of science deals with constructing explanations of how things change and how they remain stable.
- Change and rates of change can be quantified and modeled over very short or very long periods of time. Some system changes are irreversible.
- Feedback (negative or positive) can stabilize or destabilize a system.
- Systems can be designed for greater or lesser stability.

SCI.EE.5.ESS.Weath-1 Determine patterns in weather data to help predict future weather.

SCI.EE.8.ESS.Weath-1 Determine the weather data needed to describe patterns in the movement of air masses that likely cause changes in weather.

SCI.EE.8.ESS.Weath-2 Use information to describe the relationships between regional climates, locations on Earth, geographic features, and weather.

SCI.EE.12.ESS.Weath-1 Use data to determine the relationship between the absorption of the Sun's energy by Earth's spheres (i.e., geosphere, hydrosphere, atmosphere, biosphere) and trends in average global temperature.

SCI.EE.12.ESS.Weath-2 Ask questions to describe the relationship between human activity and global average temperature.

Students who demonstrate understanding can:

SCI.EE.12.ESS.Impact-1 **Improve a solution that reduces the impacts of severe weather on humans.**

DLM Disciplinary Core Idea Family

Reducing Impacts of Severe Weather

- A variety of harmful impacts to human safety (e.g., access to resources and communication systems, housing, and local environments) can result from severe weather, which can occur suddenly with little warning.
- Severe weather in a specific region can be predicted, but sometimes predictions are inaccurate.
- A situation that people want to change or create can be approached as a problem to be solved through engineering.
- Before designing a solution to solve a problem, it is important to clearly understand the problem.
- Different solutions need to be evaluated in order to determine which of them best solves the problem.
 - There are systematic processes for evaluating solutions with respect to how well they meet the criteria and constraints of a problem.
 - When evaluating solutions, it is important to take into account a range of constraints including cost, safety, reliability, and aesthetics.
- Although one design may not perform the best across all tests, identifying the characteristics of the design that performed the best in each test can provide useful information for the redesign process—that is, some of the characteristics may be incorporated into the new design.
- The iterative process of testing the most promising solutions and modifying what is proposed on the basis of the test results leads to greater refinement and ultimately to an optimal solution.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 9–12 builds on K–8 experiences and progresses to constructing and evaluating explanations about processes or relationships in the natural or designed world.

- Gather and use information to construct descriptions and explanations of processes and relationships in the natural world.
- Use data and models to evaluate and improve design solutions.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.

Students who demonstrate understanding can:

SCI.EE.12.PS.Matter-1 **Use a model to describe that substances are made of different types and numbers of atoms.**

DLM Disciplinary Core Idea Family

Matter and Chemical Reactions

- Atoms are the smallest particle of matter that comprises a substance (i.e., compounds, molecules).
- A molecule or compound (i.e., a substance) is composed of specific types and numbers of atoms.
 - Limit to simple and common substances such as sodium chloride (NaCl- salt), carbon dioxide (CO₂), oxygen (O₂), and water (H₂O).
- Examples of molecular-level models could include drawings, 3D ball and stick structures, or computer representations showing different molecules with different numbers and types of atoms.

DLM Science and Engineering Practices

Developing and Using Models: Modeling in grades 9–12 builds on K–8 experiences and progresses to developing, using, and evaluating models (e.g., maps, diagram, drawing, physical replica, diorama, graphs, dramatization, storyboard) that represent relationships, events, and systems in the natural world.

- Develop, use, and evaluate models to describe relationships between variables and components of a system.
- Use models to construct and evaluate explanations in the natural world.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- The total amount of energy and matter in closed systems is conserved.
- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system.
- Energy cannot be created or destroyed—only moves between one place and another place, between objects and/or fields, or between systems.
- Energy drives the cycling of matter within and between systems.
- In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.

Structure and Function: The way an object is shaped or structured determines many of its properties and functions.

- Investigating or designing new systems or structures requires a detailed examination of the properties of different materials, the structures of different components, and connections of components to reveal its function and/or solve a problem.
- The functions and properties of natural and designed objects and systems can be inferred from their overall structure, the way their components are shaped and used, and the molecular substructures of its various materials.

SCI.EE.12.PS.Matter-4 Use a model to support the law of the conservation of matter during chemical reactions.

Students who demonstrate understanding can:

SCI.EE.12.PS.Forces-1

Conduct an investigation to describe the relationships between force, mass, and acceleration.

DLM Disciplinary Core Idea Family

Interacting Forces

- Acceleration is the rate of change of velocity of a macroscopic object.
 - Usually, acceleration means the speed or direction of an object's motion is changing.
 - If an object is not changing its speed or direction, then the object is not accelerating.
- Newton's second law of motion is $F = ma$, where F = (net) force, m = mass, and a = acceleration.
 - When acceleration is constant, there is a direct relationship between force and mass. A larger force is needed for a more massive object to experience the same acceleration as a less massive object.
 - When mass is constant, there is a direct relationship between force and acceleration. A larger force is needed to increase the acceleration of an object.
 - When force is constant, there is an inverse relationship between mass and acceleration. When the same force is applied to two objects of differing masses, the acceleration of the more massive object is less than that of the less massive object.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.

- Use mathematical reasoning to construct and support claims about the cause-and-effect relationships between variables.
- Analyze and interpret data to investigate the relationships and characteristics of the components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- The significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs.

- Some systems can only be studied indirectly as they are too small, too large, too fast, or too slow to observe directly.
- Patterns observable at one scale may not be observable or exist at other scales.
- Using the concept of orders of magnitude allows one to understand how a model at one scale relates to a model at another scale.
- Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth).

Related NGSS Performance Expectations

HS-PS2-1 Analyze data to support the claim that Newton’s second law of motion describes the mathematical relationship among the net force on a macroscopic object, its mass, and its acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.12.PS.Forces-2

Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

DLM Disciplinary Core Idea Family

Interacting Forces

- Electric and magnetic forces can be attractive and repulsive, and their strengths or sizes depend on 1) the magnitudes of the electric charges or the strengths of the magnets involved and 2) the distances between the interacting objects.
 - Focus only on the qualitative relationships of variables in Coulomb’s law. (The greater the magnitudes of electric charges or strengths of magnets involved, the greater the attractive or repulsive force between objects. The greater the distance between the objects involved, the less the attractive or repulsive force between them.)
 - Limit to static electricity only.

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Using Mathematics and Computational Thinking: Mathematical and computational thinking in grades 9–12 builds on K–8 experiences and progresses to analyzing and interpreting data and mathematical concepts to construct meaning about systems in the natural and designed world.

- Use mathematical reasoning to construct and support claims about the cause-and-effect relationships between variables.
- Analyze and interpret data to investigate the relationships and characteristics of the components of a system.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Patterns: Observed patterns in nature guide organization and classification and prompt questions about relationships and causes underlying them.

- Different patterns may be observed at each of the scales at which a system is studied and can provide evidence for causality in explanations of phenomena.
- Classifications or explanations used at one scale may fail or need revision when information from smaller or larger scales is introduced; thus requiring improved investigations and experiments.
- Patterns of performance of designed systems can be analyzed and interpreted to reengineer and improve the system.
- Mathematical representations are needed to identify some patterns.
- Empirical evidence is needed to identify patterns.

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.
- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.

- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- The significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs.
- Some systems can only be studied indirectly as they are too small, too large, too fast, or too slow to observe directly.
- Patterns observable at one scale may not be observable or exist at other scales.
- Using the concept of orders of magnitude allows one to understand how a model at one scale relates to a model at another scale.
- Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth).

Related NGSS Performance Expectations

HS-PS2-4 Use mathematical representations of Newton’s Law of Gravitation and Coulomb’s Law to describe and predict the gravitational and electrostatic forces between objects.

HS-PS3-5 Develop and use a model of two objects interacting through electric or magnetic fields to illustrate the forces between objects and the changes in energy of the objects due to the interaction.

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Forces-1 Make observations to compare the effects of different strengths and directions of pushes and pulls on the motion of an object.

SCI.EE.5.PS.Forces-1 Make observations to determine the effects of balanced and unbalanced forces on the motion (i.e., speed and direction) of an object.

SCI.EE.5.PS.Forces-2 Provide evidence that some objects (e.g., magnets, metals, pith balls, objects falling toward Earth) exert forces on each other even when the objects are not in contact.

SCI.EE.8.PS.Forces-1 Use observations and measurements to determine how an object’s mass affects the force needed to change its motion.

SCI.EE.8.PS.Forces-2 Make observations of the motion of two colliding objects to provide evidence of Newton’s third law.

SCI.EE.12.PS.Forces-1 Conduct an investigation to describe the relationships between force, mass, and acceleration.

SCI.EE.12.PS.Forces-2 Conduct an investigation to describe the factors that affect the strength of electrical and magnetic forces between interacting objects.

Students who demonstrate understanding can:

SCI.EE.12.PS.Energy-1

Gather data to describe the thermal energy transfer between two objects or substances in contact with each other.

DLM Disciplinary Core Idea Family

Energy

- Energy can neither be created nor destroyed (see SCI.EE.8.PS.Energy-2).
- The term heat refers to the motion of particles of matter (i.e., the thermal energy of matter). The particles of hot substances move more or faster relative to particles of cold substances (see SCI.EE.8.PS.Energy-1).
 - The higher the total kinetic energy of particles of objects, the higher the temperature (i.e., thermal energy of matter).
- Heat, or thermal energy, can be transferred from one object or substance to another when those objects or substances are in contact and are at different temperatures.
 - When two objects or particles are in contact, each one exerts a force on the other that can cause kinetic energy to be transferred from one object or particle to another (see SCI.EE.8.Energy-2 and SCI.EE.8.PS.Forces-2).
 - Heat energy continuously flows from hotter objects (i.e., objects comprised of particles moving more or faster) to cooler objects (i.e., objects comprised of particles moving less or slower) until those objects are at equal temperatures (i.e., their comprising particles have equal, average kinetic energy).
- The type of matter (i.e., particles) comprising an object or substance, the size or amount of the object or substance, and the temperature of the environment in which the object or substance is found affect the amount of heat (i.e., thermal energy transfer) needed to change the objects' or substances' temperatures.
 - A substance may absorb heat without a change in temperature by changing its state of matter (i.e., melting, boiling, and condensing) (see SCI.EE.8.PS.Matter-1).

DLM Science and Engineering Practices

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Analyzing and Interpreting Data: Analyzing data in grades 9–12 builds on K–8 experiences and progresses to analyzing and evaluating to support explanations about relationships and solutions to problems in the natural world.

- Represent and analyze data to determine and describe cause-and-effect relationships between variables.
- Use data to construct and evaluate arguments.
- Analyze data to design and evaluate solutions to problems.

Constructing Explanations and Designing Solutions: Constructing explanations and designing solutions in grades 9–12 builds on K–8 experiences and progresses to constructing and evaluating explanations about processes or relationships in the natural or designed world.

- Gather and use information to construct descriptions and explanations of processes and relationships in the natural world.
- Use data and models to evaluate and improve design solutions.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)

Cause and Effect: Events have causes, sometimes simple, sometimes multifaceted. Deciphering causal relationships, and the mechanisms by which they are mediated, is a major activity of science and engineering.

- Empirical evidence is required to differentiate between cause and correlation and make claims about specific causes and effects.

- Cause and effect relationships can be suggested and predicted for complex natural and human designed systems by examining what is known about smaller scale mechanisms within the system.
- Systems can be designed to cause a desired effect.
- Changes in systems may have various causes that may not have equal effects.

Scale, Proportion, and Quantity: In considering phenomena, it is critical to recognize what is relevant at different size, time, and energy scales, and to recognize proportional relationships between different quantities as scales change.

- The significance of a phenomenon is dependent on the scale, proportion, and quantity at which it occurs.
- Some systems can only be studied indirectly as they are too small, too large, too fast, or too slow to observe directly.
- Patterns observable at one scale may not be observable or exist at other scales.
- Using the concept of orders of magnitude allows one to understand how a model at one scale relates to a model at another scale.
- Algebraic thinking is used to examine scientific data and predict the effect of a change in one variable on another (e.g., linear growth vs. exponential growth).

Systems and System Models: A system is an organized group of related objects or components; models can be used for understanding and predicting the behavior of systems.

- Systems can be designed to do specific tasks.
- When investigating or describing a system, the boundaries and initial conditions of the system need to be defined and their inputs and outputs analyzed and described using models.
- Models (e.g., physical, mathematical, computer models) can be used to simulate systems and interactions—including energy, matter, and information flows—within and between systems at different scales.
- Models can be used to predict the behavior of a system, but these predictions have limited precision and reliability due to the assumptions and approximations inherent in models.

Energy and Matter: Flows, Cycles, and Conservation: Tracking energy and matter flows, into, out of, and within systems helps one understand their system’s behavior.

- The total amount of energy and matter in closed systems is conserved.
- Changes of energy and matter in a system can be described in terms of energy and matter flows into, out of, and within that system.
- Energy cannot be created or destroyed—only moves between one place and another place, between objects and/or fields, or between systems.
- Energy drives the cycling of matter within and between systems.
- In nuclear processes, atoms are not conserved, but the total number of protons plus neutrons is conserved.

Related NGSS Performance Expectations

HS-PS3-1 Create a computational model to calculate the change in the energy of one component in a system when the change in energy of the other component(s) and energy flows in and out of the system are known.

HS-PS3-2 Develop and use models to illustrate that energy at the macroscopic scale can be accounted for as a combination of energy associated with the motions of particles (objects) and energy associated with the relative position of particles (objects).

HS-PS3-4 Plan and conduct an investigation to provide evidence that the transfer of thermal energy when two components of different temperature are combined within a closed system results in a more uniform energy distribution among the components in the system (second law of thermodynamics).

Articulation of the DCI Family Across Grade Bands

SCI.EE.2.PS.Energy-1 Make observations that energy exists.

SCI.EE.5.PS.Energy-1 Use observations to support a claim about the amount of energy moved from one place to another by sound, light, heat, and moving objects.

SCI.EE.8.PS.Energy-1 Develop a model to infer the relationship between the kinetic energy and temperature of an object or particles of a substance.

SCI.EE.8.PS.Energy-2 Provide evidence that kinetic energy is transferred between two objects when they collide with each other.

SCI.EE.8.PS.Energy-3 Develop a model to describe the behavior of light (i.e., transmission, reflection, scattering) that comes into contact with objects made of different materials.

SCI.EE.12.PS.Energy-1 Gather data to describe the thermal energy transfer between two objects or substances in contact with each other.

SCI.EE.12.PS.Energy-2 Ask questions to describe the relationship between sound energy and the vibrations of particles of matter.

Students who demonstrate understanding can:

SCI.EE.12.PS.Energy-2 **Ask questions to describe the relationship between sound energy and the vibrations of particles of matter.**

DLM Disciplinary Core Idea Family

Energy

- Sound allows us to hear and communicate.
- Sound usually travels in all directions.
- Sound transmits through a medium (e.g., air, land) via vibrations, which are detected by the ears and through touch.
 - Sound travels through air, water, and solid objects as vibrations (i.e., shaking or moving back and forth).
 - Sound results from the back-and-forth vibrations of the particles of the medium through which the sound wave is moving. When the medium is a solid, vibrations may be felt through touch.
 - When an object vibrates back and forth, they push on neighboring air particles. This causes air particles to vibrate. When these vibrating air particles reach the ears, sound is heard.
- The louder a sound, the greater the vibrations of the particles of the medium through which it travels. Therefore, a louder sound possesses more energy than a softer sound.
- The volume or loudness of a sound decreases the further it is from its source. Therefore, sound decreases in energy as it moves away from its source.

DLM Science and Engineering Practices

Asking Questions and Defining Problems: Asking questions and defining problems in grades 9–12 builds on K–8 experiences and progresses to developing and refining questions that lead to explanations.

- Develop and evaluate testable questions.
- Gain information through questioning to describe cause-and-effect relationships.

Planning and Carrying Out Investigations: Planning and carrying out investigations in grades 9–12 builds on K–8 experiences and progresses to gathering and analyzing data in an investigation to evaluate claims and design solutions.

- Manipulate variables and collect data to serve as evidence for cause-and-effect claims about the natural world.
- Gather and use data to inform the improvement of a design solution.

Crosscutting Concepts (NGSS Lead States, 2013, Appendix G)
