WISEdata Release Notes: 4/9/19

Title	Description/Comments
WDP: Modified logic in rule 6768	We modified the logic in validation rule 6768 because this rule was showing up on only one section, but since it is tied to multiple sections, it should be visible on all of them.
Roster: Roster program displays for each school section.	We now display the Roster section program for each section in the school, so the section and program association is clear. This should help users review Roster data easier and save up to five minutes each time from not having to sort out programs for each section in a school.
WDP: Added new Read-only user role	Based on numerous user requests, we created a new WISEdata agency user role that has read-only privileges. They can review data in the WISEdata Portal like the regular agency role, but they are NOT able to: -Acknowledge WARNINGS -Add or remove bookmarks -Update any data on Expected Transfer screen This new feature will allow districts to increase the number of people who are collaborating around data quality and working on high quality data submission.
WDP: Added WISEid column to student-level validation messages	Based on another heavily requested feature, we implemented a WISEid column in the student-level validation messages to save users a few minutes each time when needing to review the data in question and make edits. The WISEid column is now located by the 'First Name' column in the validation

	message detail row when it's a student-level message.
WDP: Added Single Parent characteristic to Student Characteristics export	We added the Single Parent data element to the Student Characteristics export (for v2 and v3) with a value displayed as "True" when the Single Parent element is submitted for a student. This will help users more easily identify the students who are single parents when reviewing student characteristic data.
WDP: New Entity ID column in Validation Messages export	We implemented a new column to the Validation Messages export for 'Entity ID'. This column displays to the far right of the Validation Message export and may make it simpler for users who need to manually delete information in their SIS and require an Entity ID with which to associate the validation.
