WISEdata Release Notes 9/19/23

WISEdata and Ed-Fi Updates –

L1 Error Download Capability

The WISEdata Portal L1 Error download report had a bug that was fixed. The bug created a mismatch between the date/time stamp on the WISEdata Portal screen and the .csv/download files. The fix now allows the correct date/time stamp to appear on both the user screen and on the download file.

API View, "Diagnostic Statement" Removed

The API View options on WISEdata Portal no longer display the 'diagnostic statement' from the grades endpoint due to minimal use by users.

Expect Changes to Home Screen and Data Quality Indicators Screen

DPI is working on improvements to the Data Quality Indicators (DQI) screen and the Home screen. The goal is to provide more detailed information about the data flow between WDP and the Ed-Fi Credential API (this is the 'behind the scenes' application that allows data to flow from your SIS vendor tool to the WISEdata Portal at DPI while staying safe and secure). Expect these improvements by late October.

Ed-Fi: All Student Report Card Message Bug Fixed

A bug was fixed, repairing a difference in messages between WISEdata Portal (WDP) and the Ed-Fi Credential application (Ed-Cred) for Choice schools. The message on WDP for the All Student Report Card displays either "Opt IN" or "Opt OUT." The chosen selection (IN or OUT) was displaying correctly on WDP for LEAs, but the corresponding message on Ed-Cred did not match what the vendors saw. Now everything is aligned, allowing vendors to accurately see whether the Choice school has opted in or out.
